# ( + )-11,11'-Di- $O$-methylelaiophylidene - Preparation from Elaiophylin and Total Synthesis from (R)-3-Hydroxybutyrate and (S)-Malate 

Dieter Seebach*, Hak-Fun Chow, Richard F. W. Jackson, Marius, A. Sutter, Suvit Thaisrivongs, and Jürg Zimmermann<br>Laboratorium für Organische Chemie der Eidgenössischen Technischen Hochschule, ETH-Zentrum, Universitätstraße 16, CH-8092 Zürich (Switzerland)

Eingegangen am 30. Januar 1986
The macrodiolide antibiotic elaiophylin ( $\mathbf{6}$, Scheme 1) is converted into an aglycone 8a by acid-catalysed cleavage of the deoxyfucoses in methanol, with replacement of two lactol OH -groups by $\mathrm{OCH}_{3}\left(\mathrm{C}-11\right.$ and $\left.\mathrm{C}-11^{\prime}\right)$. The di-O-methylelaiophylidene (8a), a $\mathrm{C}_{2}$-symmetrical macrodiolide with $2 \times 11$ stereogenic units, was synthesised from $(R)$-3-hydroxybutanoate (from the biopolymer PHB) and ( $S$ )-malic ester, using diastereoselective steps for the generation of the other stereogenic units. The key intermediates (Scheme 2) are the macrocyclic dialdehyde $\mathbf{1 0}$ (cf. 26, 27; $2 \times 5$ stereogenic units) and the silyl-protected dihydroxy ketone derivative 11 (cf. 34, 35; 3 stereogenic units). These two intermediates almost statistically were subjected to aldol coupling with relative topicity $u l$, using the $Z$-boron enolate of the ketone, to give the two $\mathrm{C}_{2}$-symmetrical and the asymmetric aldol ( $40 \mathrm{a}, \mathbf{b}, \mathbf{c}$ ), one of which furnished the aglycone 8a upon acid-catalysed methanolysis (Fig. 1 and 2, NMR spectra). The diastereoselective key steps, by which three of the six new asymmetric carbon atoms are created, are $\alpha$-alkylations of $\beta$-hydroxy ester or lactone alkoxide-enolates (malic acid $\boldsymbol{\rightarrow 1 2}$ and $\mathbf{1 5} \rightarrow \mathbf{1 6}$ in the dialdehyde synthesis, hydroxybutanoic acid $\boldsymbol{\rightarrow 2 9}$ in the ketone preparation).
(+)-11,11'-Di-O-methylelaiophyliden - Herstellung aus Elaiophylin und Totalsynthese aus ( $R$ )-3-Hydroxybuttersäure- und ( $S$ )-Äpfelsäureester
Das Makrodiolid-Antibiotikum Elaiophylin (6, Schema 1) kann durch säurekatalysierte Abspaltung der Desoxyfucose-Einheiten in Methanol unter gleichzeitiger Substitution der C-11- und C -11'-Lactol-OH-Gruppen durch $\mathrm{OCH}_{3}$ in das Aglycon 8a umgewandelt werden. Dieses Di- $O$-methylelaiophyliden genannte $\mathrm{C}_{2}$-symmetrische Makrodiolid 8a enthält $2 \times$ 11 stereogene Einheiten, von denen in der hier beschriebenen Totalsynthese zwei aus ( $R$ )-3Hydroxybuttersäure (aus dem Biopolymer PHB) und ( $S$ )-Äpfelsäure stammen, während die anderen durch diastereoselektive Reaktionsschritte erzeugt werden. Die zwei Schlüsselprodukte der konvergenten Synthese (Schema 2) sind der makrocyclische Dialdehyd 10 (vgl. 26, 27; $2 \times 5$ stereogene Einheiten) und das silylgeschützte Dihydroxyketonderivat 11 (vgl. 34, 35; 3 stereogene Einheiten). Aldoladdition des Z-Bor-Enolates dcs Ketons an den Dialdehyd erfolgte - beinahe statistisch - mit relativer Topizität ul und lieferte zwei $\mathrm{C}_{2}{ }^{-}$ symmetrische und ein unsymmetrisches Diaddukt ( $\mathbf{4 0 a}, \mathbf{b}, \mathbf{c}$ ), von denen eines bei der säurekatalysierten Methanolyse das Aglycon 8a lieferte (Abb. 1 und 2 zeigen die NMR-Spektren). Die diastereoselektiven Schlüsselschritte, mit denen drei der sechs neuen asymmetrischen Kohlenstoffatome erzeugt wurden, sind $\alpha$-Alkylierungen von $\beta$-Hydroxyester oder -lacton-Alkoholat-Enolaten (Äpfelsäure $\rightarrow \mathbf{1 2}$ und $\mathbf{1 5} \rightarrow \mathbf{1 6}$ bei der Dialdehydsynthese sowie Hydroxybuttersäure $\rightarrow \mathbf{2 9}$ bei der Herstellung des Ketons).

## A) Introduction

Two groups of medium-ring diolides, so-called macrodiolides ${ }^{1,2)}$ have been isolated from fungi: the unsymmetrical ones $(\mathbf{1}, \mathbf{2})$ and those with $\mathrm{C}_{2}$-symmetry (3-6) (Scheme 1).

In a series of papers ${ }^{9,11,18,22,28,40)}$ we have described the syntheses of the structurally simpler representatives $\mathbf{1 - 5}$ of this class of natural products, most of which show antibiotic activity, and of some analogues ${ }^{22,28,55,523}$. In all cases our strategy was based on the use of readily available chiral building blocks (such as lactic, 3hydroxybutyric, malic or tartaric acid) which are prepared by biological-chemical methods ("Chiral Pool") ${ }^{53,54)}$. Elaiophylin 6 is the most challenging example of this

7

8a

class of natural products to a synthetic organic chemist, and some years ago we started an effort towards a synthesis of this compound ${ }^{55)}$. This led to the preparation of a model system ${ }^{52)}$ and to the synthesis of a key diolide intermediate which employed Evans' aldol methodology (using an external auxiliary) to create two of the chirality centres in the target ${ }^{566}$. We describe here, in full ${ }^{57}$, the total synthesis of an aglycone of elaiophylin (dimethylelaiophylidene) from ( $R$ )-3-hydroxybutyrate and ( $S$ )-malate.

## B) Elaiophylin, an aglycone and a strategy

Elaiophylin (6) was isolated, originally, from cultures of Streptomyces melanosporus ${ }^{41}$ and exhibits activity against gram-positive bacteria. Compounds which ultimately proved to be identical with elaiophylin were subsequently isolated from other strains of Streptomyces (Scheme 1) ${ }^{42-44}$ ). The constitution of elaiophylin was first elucidated in $1981{ }^{49)}$, and later the relative and absolute configuration were determined by X-ray analysis ${ }^{47-49}$ and NMR studies ${ }^{48,50}$.

Despite many attempts to remove the 2,6-deoxyfucose carbohydrate moieties from elaiophylin, the aglycone 7 has never been reported ${ }^{45,58)}$, and treatment with both mild acid and base led to complete decomposition. This observation indicates that the synthesis of elaiophylin from an aglycone would be extremely difficult. We have made extensive studies on the cleavage of elaiophylin under acidic conditions, and it became rapidly clear that only in the presence of methanol (and absence of water) identifiable derivatives, in which the central macrodiolide ring was intact, could be detected. In the presence of $p$-toluenesulfonic acid, it is pos-

Liebigs Ann. Chem. 1986

Figure 1. $300-\mathrm{MHz}{ }^{1} \mathrm{H}$ NMR spectra of aglycones of elaiophylin 6
A: $(+)-11,11^{\prime}-\mathrm{Di}-O$-methylelaiophylidene ( $8 \mathbf{a}$ ), by cleavage of 6 with $p$-toluenesulfonic acid in methanol. - B: Monoaglycone 9 of $11,11^{\prime}$-di- $O$-methylelaiophylin, by cleavage of 6 with lanthanum trichloride in methanol. - C: Elaiophylidene (8a) from the total synthesis.

Liebigs Ann. Chem. 1986
sible, however, to isolate the dimethyl aglycone $\mathbf{8 a}$, in which both lactols have been converted into methyl acetals and both deoxyfucose molecules have been removed. The proton NMR spectrum of this aglycone is shown in Figure 1, A. It is clear that there are two molecules of methanol strongly associated with the aglycone ${ }^{59}$. If, on the other hand, $p$-toluenesulfonic acid is replaced by lanthanum trichloride, which is thought to be less acidic ${ }^{60.61)}$, it is then possible to isolate a monoaglycone 9 , in which both of the lactols have been converted into methyl acetals, but only one sugar has been removed. It is apparent from the proton NMR spectrum (Figure 1, B) that this molecule also has two molecules of methanol strongly associated with it. The isolation of the monoaglycone 9 clearly demonstrates that the fastest step in the methanolysis is the conversion of the lactols to methyl acetals (substitution of OH in position 11 by $\mathrm{OCH}_{3}$ ).

Scheme 2

Liebigs Ann. Chem. 1986

The instability of the aglycone $8 \mathbf{a}$ under acidic conditions in the presence of water precludes its conversion into elaiophylin itself, since it is clearly impossible to convert a methyl acetal into a free lactol without water ${ }^{62)}$. An alternative approach would have required the coupling of a protected derivative of deoxyfucose (e.g. a glycosyl fluoride) with the aglycone $8 \mathbf{a}$ (possibly also protected at C-$9-\mathrm{OH})$, followed by removal of all the protecting groups. This would have required both the hydrolysis of the methyl acetal in the presence of the glycosidic bond, and also protecting groups on the deoxyfucose moiety which could be removed under neutral conditions, a formidable set of requirements. We therefore did not investigate this possibility. Thus, our target was the dimethyl aglycone 8a which showed similar biological activity to elaiophylin itself.

Our retrosynthetic analysis is presented in Scheme 2 . We proposed firstly to disconnect the masked $\beta$-hydroxy ketone function in the aglycone 8 a to give a central macrocyclic dialdehyde 10 and two identical side-chain ethyl ketones 11. We proposed to construct the central macrocycle by dimerisation of a suitably monoprotected dihydroxy acid, which may be obtained from malic acid, and to prepare the side chain from 3-hydroxybutyric acid. The final aldol coupling reaction between the dialdehyde 10 and the ketone 11 would, we realised, be hard to control ${ }^{633}$ but an alternative strategy involving postponement of the macrodiolide ring formation to the final step, thereby exploiting the $\mathrm{C}_{2}$-symmetry to its utmost effect, would have required an unmanageable array of protecting groups in such a sensitive molecule ${ }^{45,58)}$.

## C) The synthesis of the central ring ( 10,27 )

The starting material ${ }^{64)}$ for our synthesis was the benzaldehyde acetal 12, available in five steps from diethyl ( $S$ )-malate ${ }^{65)}$. Conversion of the free hydroxy group into the triflate using trifluoromethanesulfonic anhydride and pyridine ${ }^{66)}$ was followed by immediate reaction with sodium cyanide in hexamethylphosphoric triamide to give the chain-extended nitrile 13 in $57 \%$ yield ${ }^{67}$. Hydration of the nitrile function was accomplished using Corey's hydrogen peroxide/1-hexene procedure ${ }^{687}$ to give the amide 14 in $97 \%$ yield. Hydrogenolysis of the benzylidene acetal, employing $20 \%$ palladium hydroxide on charcoal as catalyst, led to the corresponding diol which could not be isolated in pure form, but was instead treated with 1 N hydrochloric acid to give the lactone 15 in $70 \%$ yield from 14.

The lactone 15 could be methylated ${ }^{69,70)}$ in $75 \%$ yield (with $12 \%$ recovery of the starting material) and with diastereoselectivity greater than 99 to 1 , by treatment with two equivalents of lithium diisopropylamide at $-60^{\circ} \mathrm{C}$ for two hours, addition of $n$-butyllithium to deprotonate the free diisopropylamine formed, and then quenching of the enolate with methyl iodide. Omission of the $n$-butyllithium led to significantly lower yields of the methylated product 16 , and correspondingly greater recovery of the lactone $15^{71)}$. Opening of the lactone 16 could be achieved using sodium methoxide in methanol to produce a dihydroxy methyl ester which was not purified but instead selectively protected at the primary hydroxy group using Hanessians's tritylpyridinium tetrafluoroborate procedure ${ }^{72)}$ to give the

12

15

13

16

14

17
monotrityl ether 17 in $48 \%$ overall yield from the lactone 16 ( $18 \%$ recovery). The proton NMR spectrum of the trityl ether 17 indicated that it was contaminated with $3 \%$ of a diastereoisomeric product, presumably formed by methoxide-induced epimerisation.

18

19

20

At this stage of our route it was necessary to alter the oxidation states at the termial carbon atoms of the chain. This process was initiated by reduction of the methyl ester function of $\mathbf{1 7}$ using $\mathrm{LiAlH}_{4}$ in ether to give in $98 \%$ yield the diol $\mathbf{1 8}$ which was then treated with dimethoxypropane and a catalytic amount of $p$ toluenesulfonic acid to produce the dioxane 19 in $91 \%$ yield. Removal of the trityl protecting group was accomplished using lithium in liquid ammonia to give the alcohol $20(72 \%)$, identical with the compound which we had prepared by our alternative route ${ }^{56)}$.

In Scheme 3 the logistics and overall efficiency of the two routes are compared. The alcohol 20 can be converted into the macrocyclic diol 27 via the intermediates 21 to 26 as we have described previously ${ }^{561}$. Oxidation of the diol 27, using Swern's conditions, gave the dialdehyde 10 in $91 \%$ yield. The dialdehyde was generally used immediately in the aldol reaction.

## Scheme 3

Method A: Convergent, using an external chiral auxiliary. 8 steps ( $35 \%$ overall yield) to $\mathbf{2 0}$; 3 steps to make the chiral auxiliary from D-valine, yield $82 \%$; recovery of chiral auxiliary after Evans' aldol addition: 78\%.
Method B: Linear, starting from the pool of chiral building blocks, 13 steps ( $7 \%$ overall yield) to 20.

## D) Synthesis of the side chain $(11,35)$

At first, we synthesised a bis(tert-butyldimethylsilyl)-protected ketone 28a. However, it was shown that the two TBDMS groups could be removed neither prior to nor after the final aldol coupling reaction without extensive decomposition ${ }^{55)}$. Studies on the ketone $\mathbf{2 8} \mathbf{b}$ indicated that it was very unstable. We therefore decided that two different protecting groups are necessary at C-5 and C-7 of the ketone (C-13 and C-15 of the final carbon skeleton) to ensure that in the deprotection step the free $\beta$-hydroxy ketone function at $\mathrm{C}-5$ ( $\mathrm{C}-13$ ) would not be exposed.

Selective removal of the C-7 (C-15) hydroxy protective group would, we hoped, permit the cyclisation to a $\delta$-lactol which would then not be so prone to elimination.

28 a

$28 b$

29

30

31

32

33

The side-chain aldol derivative of type 11 which was eventually used in the synthesis, was prepared as follows. Treatment ${ }^{69,70)}$ of the ethyl ( $R$ )-3-hydroxybuyrate, prepared from the biopolymer $\mathrm{PHB}^{733}$, with two equivalents of lithium diisopropylamide and three equivalents of ethyl iodide gave the diastereoisomerically pure ester 29 in $84 \%$ yield. Protection of the hydroxy group of 29 using triethylsilyl trifluoromethanesulfonate and lutidine led to the triethylsilyl ether $\mathbf{3 0}$ in quantitative yield. Reduction of the ester function to give the alcohol 31 was carried out using diisobutylaluminium hydride in $96 \%$ yield. When $\mathrm{LiAlH}_{4}$ was used for the reduction, substantial amounts of the product of silyl migration from the secondary to the primary oxygen function were observed. Swern oxidation of the alcohol 31 then gave the aldehyde 32 in $84 \%$ yield. The partner for the
projected Mukaiyama aldol reaction, 2-trimethylsilyloxy-1-butene (33), was prepared free of its regioisomer by deprotonation of 2-butanone with lithium 2,2,6,6tetramethylpiperidide, followed by quenching with trimethylsilyl chloride and fractional distillation.

After a series of experiments to effect the aldol coupling between the aldehyde 32 and the silyl enol ether $\mathbf{3 3}$ using various Lewis acids, we found that titanium tetrachloride at $-75^{\circ} \mathrm{C}$ in dichloromethane led to the formation of a single isolable aldol adduct 34 in $38 \%$ yield. This aldol adduct 34 could be purified by flash chromatography, but the neat compound decomposed very rapidly and so it was protected as the tert-butyldimethylsilyl ether immediately. Initially we tried to use tert-butyldimethylsilyl triflate in the presence of lutidine to effect the silylation. This led, however, to an equimolar mixture of the required silyl ether 35 and its isomer in which the two silyl protecting groups at C-5 and C-7 were interchanged. Presumably, this isomerisation was caused by lutidine-induced silyl transfer via a six-membered transition state ${ }^{744}$. Use of Corey's original procedure, employing imidazole and tert-butyldimethylsilyl chloride in dimethylformamide ${ }^{75)}$, gave the required bis-protected diol 35 in rather poor yield ( $42 \%$ ) and very slowly ( 80 hours).

34

35

36

37

$\mathrm{J}_{\mathrm{ab}}=10.5 \mathrm{~Hz}$

In order both to establish the configuration of the aldol adduct 34 and to ascertain whether the protected $\delta$-hydroxy ketone function could be converted into a cyclic methyl acetal, the bis-protected aldol 35 was treated with water/acetic acid/tetrahydrofuran $(3: 5: 11)^{76)}$ to give the $\delta$-lactol 36 ( $97 \%$ ) which was immediately treated with pyridinium $p$-toluenesulfonate in methanol to give the methyl acetal 37 in $77 \%$ yield. Removal of the tert-butyldimethylsilyl group was then achieved using tetra- $n$-butylammonium fluoride in tetrahydrofuran to give the hydroxy compound 38 in $94 \%$ yield. The signal [doublet of triplets ( $J=4.8$ and 10.5 Hz$)$ ] due to the hydrogen on $\mathrm{C}-4$ in the proton NMR spectrum of this

Licbigs Ann. Chem. 1986
acetal 38 clearly indicates that this proton is trans-diaxial to two protons $\left(3-\mathrm{H}_{\mathrm{ax}}\right.$ and $5-\mathrm{H}$ ), and therefore the configuration at $\mathrm{C}-4$ is $R$. The stereochemical course of the aldol addition in which the isolated product is formed according to the open-chain model of Cram's rule, requires some comment. Products which are formed following the open-chain model have been observed in systems with potential chelating groups, which would normally be expected to follow the cyclic model ${ }^{77}$. The low yield in this reaction suggests, perhaps, that the other diastereoisomer may indeed be formed but that it is even more unstable than the product which we isolate (i.e., the reaction might not have been selective at all!).

## E) The aldol coupling of the side chain to the macrocyclic dialdehyde

The crucial step in the synthesis had now been reached. We felt that the best way to ensure that the newly created centres of chirality in the aldol reaction were generated with relative topicity $u l^{78)}$ (to give a syn product in Masamune's nomenclature) would be to prepare the di-n-butylboron enolate of the ketone 35. It is well-known that it is possible to prepare $Z$-boron enolates with high stereoselectivity and that these enolates undergo ul-addition to aldehydes highly selectively ${ }^{79-81}$. Evans has observed that enolisation of ethyl isobutyl ketone using di- $n$-butylboron triflate occurs exclusively at the methylene position of the ethyl group, which is analogous to the selectivity which we require ${ }^{81}$. Indeed, treatment of the ketone 35 with di- $n$-butylboron triflate in ether, and subsequent reaction with benzaldehyde, gave a $51 \%$ yield of an inseparable mixture of two syn-aldol adducts 39 after oxidative work-up, according to the established assignment of configuration by proton NMR spectroscopy. We were therefore confident that we had generated the required $Z$-enolate. What remained to be determined was the combined diastereofacial selectivities of the dialdehyde $\mathbf{1 0}$ and the di- $n$-butylboron enolate of the ketone 35.

39 a

$39 b$

$u$

ul

Treatment of the dialdehyde 10 with four equivalents of the di- $n$-butylboron enolate of the ketone 35 led to three stereoisomers 40 ( $3: 5: 6$ or 21,37 , and $42 \%$ d. s., respectively; $42 \%$ combined yield) as the only isolable aldol adducts, which were easily separable by flash chromatography. Of these products, two had $C_{2^{-}}$ symmetry, whilst the third was unsymmetrical, as evident from the proton NMR spectrum. Assuming that only $u l$ coupling of the trigonal centres had occurred, the formation of three isomers is indeed expected (see formula 40 and the schematic representations $\mathbf{A}, \mathbf{B}$, and $\mathbf{C}$ ). Thus, the unsymmetrical product ( $42 \%$ d. s.) should have the structure $40 \mathrm{~b}(c f . \mathrm{B})$. We were unable, at this point, to assign the configurations of the two $\mathrm{C}_{2}$-products. The proton NMR spectrum of the unsymmetrical product was a linear combination of the proton NMR spectra of the two $C_{2}$ products. After numerous efforts to find conditions which would permit the cleavage of the triethylsilyl ether groups of the aldol adducts 40 including the conditions used in the establishment of the configuration of the ketone 35 , we eventually discovered that the use of $p$-toluenesulfonic acid in methanol, the conditions used for making the aglycone 8a, effected all the transformations required: cleavage of the triethylsilyl ether, cyclisation to the lactol, methyl acetal formation and cleavage of the tert-butyldimethylsilyl ether. This order of steps is mechanistically reasonable ( $c f$. the model series $35 \rightarrow 36 \rightarrow 37 \rightarrow 38$ ). The stereoisomer 40 formed with

Liebigs Ann. Chem. 1986
$21 \%$ d. s. gave, under these conditions, a product ( $17 \%$ yield) which proved to be identical to the dimethyl aglycone $\mathbf{8 a}$, prepared from elaiophylin, by comparison of $R_{\mathrm{F}}$ values, proton NMR (shown in Figure 1, C) and infrared spectra, and of the sense and value of optical rotation. This unambiguously established the configuration of this stereoisomer of 40 to be $\mathbf{4 0}$ a, as well as establishing the configuration of the other symmetrical aldol adduct ( $37 \% \mathrm{~d}$. s.) as $\mathbf{4 0}$ c. Treatment of $40 b$ and $40 c$ with $p$-toluenesulfonic acid in methanol led to $8 b$ and $8 c$, respectively, which were both different from the natural aglycone 8a. Again the proton NMR spectrum of the unsymmetrical compound $\mathbf{8 b}$ was a linear combination of the proton NMR spectra of $8 \mathbf{a}$ and $\mathbf{8 c}$ (see Figure 2).

Figure 2. Comparison of the $3-7-\mathrm{ppm}$ part of the $300-\mathrm{MHz}{ }^{1} \mathrm{H}$ NMR spectra of the diastereomers $8 \mathbf{a}, \mathrm{~b}$, and $\mathbf{c}$ (cf. A, B, and $\mathbf{C}$ below formula $\mathbf{4 0}$ ); for assignment of signals see experimental section

## E) Concluding remarks

In our synthesis of elaiophylidene (8a) the eleven independent stereogenic units, two double bonds and nine asymmetric carbon atoms, have the following origin: (i) three units are introduced directly from the starting materials methyl (E)-4bromocrotonate $[C(2)-C(3)]$, ethyl $(R)$-3-hydroxybutyrate $[C(15)]$ and ( $S$ )-malic acid $[\mathrm{C}(7)]$; (ii) three units were generated by coupling of trigonal centres during the Wittig reaction $[C(4)-C(5)]$ and in the final aldol coupling step $[C(9), C(10)]$; (iii) one centre was created in a nucleophilic addition with 1,2 -asymmetric induction subject to Cram's rules [C(13)]; (iv) three centres of chirality were generated
by electrophilic attack on enolate double bonds with 1,2-asymmetric induction $[C(6), C(8), C(14)] ;(v)$ and finally, the methyl acetal centre $[C(11)]$ is formed under the influence of stereoelectronic control ${ }^{82}$. We have given discussions of the above methods (i), (ii), and (iv) in previous papers, see ref. ${ }^{54)}$, ref. ${ }^{78,83)}$, and ref. ${ }^{84)}$, respectively.

The final attachment of the side-chain ketone 35 to the macrodiolide dialdehyde 10 (cf. also Scheme 2) deserves some additional comments. Although a total yield of $42 \%$, of which only one fifth is the desired stereoisomer, may appear to be a poor result, it actually demonstrates how powerful a method the aldol addition has recently become ${ }^{855}$ : the ketone 35 with two methylene groups $\alpha$ to the carbonyl is added to the aldehyde $\mathbf{1 0}$ regio- and diastereoselectively. In principle, three constitutional isomers could have resulted from a non-regioselective reaction, and with unselective $l k$ and $u l$ combination of the two trigonal centres nine diastereoisomers of correct constitution could have been formed. Thus, the three isomers which are actually isolated represent a very small selection of all those possible.

Our synthesis emphasises the fact that, at present, there is no method available to control, in an absolute sense, the configurations of asymmetric carbon atoms formed by the coupling of trigonal centres of two complex molecules ${ }^{63,86)}$. It can therefore be considered fortuitous that the coupling between ketone $\mathbf{3 5}$ and dialdehyde $\mathbf{1 0}$ with relative topicity $u l$ is nearly statistical (compare $1: 2: \mathbf{1}$ with the observed $1: 1.7: 2$ ), and not biased in the undesired direction, to a disasterous degree, by Cram's rule or by chelation control.

The synthesis described here is yet another demonstration of the fact that "we can now make a few milligrams of anything whose structure we can draw, that is stable, and has fewer than a thousand atoms" ${ }^{87}$. The conclusions that we can draw from this synthesis are that we should attempt to find solutions to the problems of coupling complex molecules stereoselectively and of making and breaking glycosidic bonds in molecules as sensitive as elaiophylidene and elaiophylin.

We gratefully acknowledge helpful discussions with and receipt of generous samples of elaiophylin from Professor Dr. W. Keller-Schierlein of our Laboratory, Dr. A. von Wartburg, and Dr. W. Pache (Sandoz AG, Basel) for carrying out biological tests, the staff of the analytical department of the ETH organic chemistry institute for obtaining the analytical data, Miss B. Brandenberg for measuring the NMR spectra, and Mr. K. Job (Kilolabor) and Mr. G. Scherpenhuyzen for the preparation of starting materials. This work was supported by a grant from the Schweizerischer Nationalfonds zur Förderung der wissenschaftlichen Forschung (Project Nr. 2.306-0.81 and Project Nr. 2.253-0.84) and by the Sandoz AG (Basel). R. F. W. J. thanks the Royal Society for a fellowship in the European Exchange Programme.

## Experimental

Melting points were determined with a Büchi/Tottoli melting point apparatus and are uncorrected. - The temperature of Kugelrohr distillations is that of the air bath. - Merck Kieselgel 60 (silica, mesh size $0.040-0.063$ ) was used for flash chromatography. - Specific rotations were determined with a Perkin-Elmer 241 polarimeter using $\mathrm{CHCl}_{3}$ as solvent at
$25^{\circ} \mathrm{C}$. The concentration is given in $\mathrm{g} / 100 \mathrm{ml}$. - IR spectra were recorded using a PerkinElmer 297 spectrometer either as KBr discs or in $\mathrm{CHCl}_{3}$ solution. - ${ }^{1} \mathrm{H}$ NMR spectra were obtained with either a Varian EM-390 (90 MHz) or a Bruker WM $300(300 \mathrm{MHz})$ instrument. ${ }^{13} \mathrm{C}$ NMR spectra were obtained using a Varian CFT-20 instrument. All spectra were recorded using TMS as internal standard in $\mathrm{CDCl}_{3}$ as solvent. Signals marked with an asterisk (*) disappear on addition of $\mathrm{D}_{2} \mathrm{O}$. - Mass spectra were recorded at 70 eV with a Hitachi-Perkin-Elmer RMV 6M instrument. All reaction solvents, except for tetrahydrofuran (THF) and hexamethylphosphoric triamide (HMPT) were of purissimum quality. THF was distilled from potassium/benzophenone ketyl immediately before use. HMPT was distilled over $\mathrm{CaH}_{2}$ under reduced pressure. All reactions were carried out in oven-dried glassware under argon. Unless otherwise stated, organic extracts were dried with $\mathrm{MgSO}_{4}$ and concentrated using a rotary evaporator. Buffer solution of $\mathrm{pH}=7$ was prepared by dissolving potassium dihydrogen phosphate ( 85 g ) and sodium hydroxide ( 14.5 g ) in water ( 950 ml ).
The numbering system (IUPAC) in the experimental part is different from that in the text (trivial nomenclature).

Numbering system according to IUPAC for compounds of type $\mathbf{8}$ and $\mathbf{4 0}$ (this system is used in the Experimental Part only).

Methanolysis of elaiophylin (6) - Synthesis of the methoxy aglycone 8,16-bis[3-(5-ethyl-3,4,5,6-tetrahydro-4-hydroxy-2-methoxy-6-methyl-2H-pyran-2-yl)-2-hydroxy-1-methylbu-tyl]-7,15-dimethyl-1,9-dioxacyclohexadeca-3,5,11,13-tetraene-2,10-dione (8a): A mixture of elaiophylin ( $50 \mathrm{mg}, 0.0488 \mathrm{mmol}$ ) and $p$-toluenesulfonic acid ( 10 mg ) in dry methanol ( 10 ml ) was stirred at $20^{\circ} \mathrm{C}$ for 3 h . The mixture was poured into phosphate buffer ( $\mathrm{pH}=7 ; 3 \mathrm{ml}$ ) and the methanol evaporated. The residue was dissolved in ether ( 50 ml ), washed with phosphate buffer ( $\mathrm{pH}=7$ ), dried, filtered, and evaporated. The residue was chromatographed on Merck silica gel plate $\left(60 \mathrm{~F}_{254}\right)$ developing with ether/hexane (3:1) to give a homogeneous fraction 8a ( $20 \mathrm{mg}, 49 \% ; R_{\mathrm{F}}=0.28$ ) as an oil; $[\alpha]_{\mathrm{D}}=+68.0(c=0.54$, $\left.\mathrm{CCl}_{4}\right) .-\operatorname{IR}\left(\mathrm{CCl}_{4}\right): 3600-3350(\mathrm{O}-\mathrm{H}), 1700(\mathrm{C}=\mathrm{O}), 1640(\mathrm{C}=\mathrm{C}), 1612(\mathrm{C}=\mathrm{C}) .-$ ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{H}_{6}$ ) (for numbering see formula above): $\delta=0.42^{*}(\mathrm{br} ., 6 \mathrm{H}, 4 \mathrm{OH}$ and 2 MeOH$), 0.61\left(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 6 \mathrm{H}, 2 \mathrm{CH}_{3}\right), 0.84\left(\mathrm{~d}, J=6.5 \mathrm{~Hz}, 6 \mathrm{H}, 2 \mathrm{CH}_{3}\right), 0.95(\mathrm{t}$, $\left.J=7.6 \mathrm{~Hz}, 6 \mathrm{H}, 2 \mathrm{CHCH}_{2} \mathrm{CH}_{3}\right), 1.24\left(\mathrm{~d}, J=6.2 \mathrm{~Hz}, 6 \mathrm{H}, 2 \mathrm{CH}_{3}\right), 1.25-1.76(\mathrm{~m}, 6 \mathrm{H}$, $\left.2 \mathrm{CHCH}_{2} \mathrm{Me}\right), 1.32\left(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 6 \mathrm{H}, 2 \mathrm{CH}_{3}\right), 1.82[\mathrm{dd}, J \doteq 13.2$ and $10.7 \mathrm{~Hz}, 2 \mathrm{H}$, $\left.2 \mathrm{H}_{\mathrm{ax}} \mathrm{C}\left(3^{\prime \prime}\right)\right], 1.90-1.97\left[\mathrm{~m}, 2 \mathrm{H}, 2 \mathrm{HC}\left(1^{\prime}\right)\right], 2.18-2.30\left[\mathrm{~m}, 4 \mathrm{H}, \mathrm{HC}(7), \mathrm{HC}(15)\right.$ and $\left.2 \mathrm{HC}\left(3^{\prime}\right)\right]$, $2.84\left[\mathrm{dd}, J=13.2\right.$ and $\left.4.6 \mathrm{~Hz}, 2 \mathrm{H}, 2 \mathrm{H}_{\mathrm{eq}} \mathrm{C}\left(3^{\prime \prime}\right)\right], 3.08(\mathrm{~s}, 6 \mathrm{H}, 2 \mathrm{OMe}), 3.13(\mathrm{~s}, 6 \mathrm{H}, 2 \mathrm{MeOH})$,
$3.55-3.65\left[\mathrm{~m}, 4 \mathrm{H}, 2 \mathrm{HC}\left(4^{\prime \prime}\right)\right.$ and $\left.2 \mathrm{HC}\left(6^{\prime \prime}\right)\right], 3.90\left[\mathrm{dd}, J=9.4\right.$ and $\left.3.8 \mathrm{~Hz}, 2 \mathrm{H}, 2 \mathrm{HC}\left(2^{\prime}\right)\right]$, 5.05 [dd, $J=9.9$ and $1.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{HC}(8)$ and $\mathrm{HC}(16)], 5.15$ [dd, $J=15.0$ and $9.5 \mathrm{~Hz}, 2 \mathrm{H}$, $\mathrm{HC}(6)$ and $\mathrm{HC}(14)], 5.39[\mathrm{~d}, J=15.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{HC}(3)$ and $\mathrm{HC}(11)], 5.73$ [dd, $J=15.1$ and $11.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{HC}(5)$ and $\mathrm{HC}(13)$ ], 7.02 [dd, $J=15.3$ and $11.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{HC}(4)$ and $\mathrm{HC}(12)]$.
(3R,4S)-3,5-Benzylidenedioxy-4-methylpentanenitrile (13): Trifluoromethanesulfonic anhydride ( $8.8 \mathrm{ml}, 54 \mathrm{mmol}$ ) was added dropwise to a solution of the alcohol $12(10 \mathrm{~g}, 48$ mmol ) and pyridine ( $6.5 \mathrm{ml}, 80 \mathrm{mmol}$ ) in dichloromethane ( 40 ml ) at $0^{\circ} \mathrm{C}$ over 30 min . The solution was stirred at $0^{\circ} \mathrm{C}$ for 30 min , and then washed with ice-cold water ( $2 \times 30 \mathrm{ml}$ ). The organic phase was dried and added dropwise to a solution of sodium cyanide ( 2.6 g , 53 mmol ) in HMPT ( 30 ml ). The brown solution was stirred for 4 h at $20^{\circ} \mathrm{C}$ and then water $(100 \mathrm{ml})$ was added. The mixture was extracted with dichloromethane ( $3 \times 80 \mathrm{ml}$ ). The combined organic layers were washed with water ( 100 ml ), dried, and evaporated. The residue was purified by flash chromatography (eluant hexane/ethyl acetate, $4: 1$ ) to give the nitrile $13(5.9 \mathrm{~g}, 57 \%)$. - M. p. $66-67^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}=+3.2\left(c=1.4, \mathrm{CHCl}_{3}\right) .-\mathrm{IR}(\mathrm{KBr})$ : $2980(\mathrm{~m}, \mathrm{CH}), 2250(\mathrm{w}, \mathrm{C} \equiv \mathrm{N}) .-{ }^{1} \mathrm{H} \operatorname{NMR}(300 \mathrm{MHz}): \delta=0.86\left(\mathrm{~d}, J=6,7 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$, $1.96-2.14\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CHCH}_{3}\right), 2.64$ (dd, $J=6.4$ and $17.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\mathrm{A}} \mathrm{CN}$ ), 2.75 (dd, $J=$ 3.9 and $17.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\mathrm{B}} \mathrm{CN}$ ), $3.55\left(\mathrm{t}, J=11.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\mathrm{A}} \mathrm{O}\right), 3.68-3.78(\mathrm{~m}, 1 \mathrm{H}$, $\mathrm{CH}-\mathrm{O}), 4.16\left(\mathrm{dd}, J=4.8\right.$ and $\left.11.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\mathrm{B}} \mathrm{O}\right), 5.52(\mathrm{~s}, 1 \mathrm{H}, \mathrm{O}-\mathrm{CH}-\mathrm{O}), 7.32-5.54$ $(\mathrm{m}, 5 \mathrm{H}, \mathrm{Ar}) .-{ }^{13} \mathrm{C}$ NMR ( 25.2 MHz ): $\delta=12.1$ (q), 22.4 (t), 33.7 (d), 72.3 (t), $78.1(\mathrm{~d}), 101.3$ (d), 116.9 (s), 126.2 (d), 128.4 (d), 129.1 (d), 137.8 (s). - MS: $m / \Sigma=217\left(24 \%, \mathrm{M}^{+}\right), 216$ $\left(46 \%, \mathrm{M}^{+}-1\right), 105(100 \%), 77\left(37 \%, \mathrm{Ar}^{+}\right)$.

Methyl (2R,3S,4S)-3-hydroxy-2,4-dimethyl-5-trityloxypentanoate (17): The lactone 16 ( $200 \mathrm{mg} ; 1.4 \mathrm{mmol}$ ) was dissolved in dry methanol ( 50 ml ). Sodium methoxide ( $160 \mathrm{mg} ; 3$ mmol ) was added at $0^{\circ} \mathrm{C}$ and the suspension was stirred for 16 h at this temperature. Phosphate buffer ( $\mathrm{pH}=7,7 \mathrm{ml}$ ) was added and the solution was evaporated to a volume of 10 ml . The solution was extracted with dichloromethane ( $3 \times 20 \mathrm{ml}$ ) and the combined organic layers were dried and evaporated. The oil was dissolved in acetonitrile ( 20 ml ) and tritylpyridinium tetrafluoroborate ( $820 \mathrm{mg} ; 2 \mathrm{mmol}$ ) was added. The yellow solution was stirred for 2 h and the solvent was then evaporated. The residue was filtered through flash silica ( $10 \times 2 \mathrm{~cm}$ column, eluant hexane/ether, $4: 1$ ) to give, after evaporation of the solvent, the monotrityl ether 17 as a colourless oil ( $285 \mathrm{mg}, 49 \%$ ), homogenous by TLC (ether/ hexane, $1: 4$ ) though evidently contaminated with about $3 \%$ of the epimerised ( $\alpha$ to the ester) compound. The lactone 16 ( $35 \mathrm{mg}, 18 \%$ ) was recovered after further elution with ether. A sample of the ester 17 exhibited the following data: $[\alpha]_{\mathrm{D}}=14.3$ ( $c=1.05$ ). -IR $\left(\mathrm{CHCl}_{3}\right): 3500(\mathrm{~m}, \mathrm{OH}), 1725(\mathrm{~s}, \mathrm{C}=\mathrm{O}) .-{ }^{1} \mathrm{H}$ NMR ( 300 MHz ): $\delta=0.91(\mathrm{~d}, J=6.9 \mathrm{~Hz}$, $\left.3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.14\left(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.72-1.84(\mathrm{~m}, 1 \mathrm{H}, 4-\mathrm{CH}), 2.5(\mathrm{dq}, J=3.9$ and $7.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}-\mathrm{C}=\mathrm{O}), 3.20-3.38\left(\mathrm{~m}, 3 \mathrm{H}, 5-\mathrm{CH}_{2}\right.$ and OH$), 3.68\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.82-3.92$ $(\mathrm{m}, 1 \mathrm{H}, 3-\mathrm{CH}), 7.40-7.68(\mathrm{~m}, 15 \mathrm{H}, \mathrm{Ar}) .-{ }^{13} \mathrm{C}$ NMR $(25.2 \mathrm{MHz}): \delta=9.7,14.2,42.3,51.7$, $67.3,75.4,87.3,127.1,127.8,128.6,143.8,176.1 .-$ MS: $m / z=243\left(100 \%, \mathrm{Tr}^{+}\right) .175(4 \%$, $\left.\mathrm{M}^{+}-\mathrm{Tr}\right), 149(54 \%)$.

(2S,3S,4S)-3,5-Isopropylidenedioxy-2,4-dimethyl-1-pentanol (20): Lithium ( $20 \mathrm{mg}, 2.9$ mmol ) was added to liquid ammonia ( 10 ml ) cooled to $-78^{\circ} \mathrm{C}$. When all the lithium had dissolved, a solution of the trityl ether $19(100 \mathrm{mg}, 0.23 \mathrm{mmol})$ in dry THF ( 1 ml ) was added over a period of 3 min . The cooling bath was removed and the mixture then stirred at reflux for 30 min . The reaction was then quenched by the careful addition of ammonium chloride $(160 \mathrm{mg})$. Ammonia was allowed to evaporate, and then saturated brine ( 2 ml ) was added. The mixture was diluted with water ( 5 ml ), extracted with ether ( $3 \times 10 \mathrm{ml}$ ), then with dichloromethane ( $3 \times 10 \mathrm{ml}$ ). The combined organic extracts were dried and evaporated, and the residue was purified by flash chromatography (eluant ether/hexane, $1: 1$ ) to give the alcohol $20(31 \mathrm{mg}, 71 \%)$ identical in all respects with the material prepared by the other route ${ }^{56 \pi}$.
(3E,5E,7S,8S,11E,13E,15S,16S)-8,16-Bis[(1R)-1-formylethyl]-7,15-dimethyl-1,9-dioxacy-clohexadeca-3,5,11,13-tetraene-2,10-dione (10): Oxalyl chloride ( $50 \mu \mathrm{l}, 0.57 \mathrm{mmol}$ ) was dissolved in dichloromethane ( 3 ml ) and cooled to $-78^{\circ} \mathrm{C}$ under an argon atmosphere. Dimethyl sulfoxide ( $80 \mu \mathrm{l}, 1.1 \mathrm{mmol}$ ) was added and, after the solution had been stirred for 2 min , the diol $27^{56}$ ( $98 \mathrm{mg}, 0.25 \mathrm{mmol}$ ), dissolved in dichloromethane ( 1 ml ) and dimethyl sulfoxide ( 0.2 ml ), was then added. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 15 min and then triethylamine ( $0.35 \mathrm{ml}, 2.5 \mathrm{mmol}$ ) was added, and the mixture stirred for further 25 min at $-78^{\circ} \mathrm{C}$. The cooling bath was removed, and after 15 min the reaction mixture was poured
into dilute hydrochloric acid ( $0.5 \mathrm{~N}, 5 \mathrm{ml}$ ). The organic layer was separated and the aqueous layer re-extracted with dichloromethane ( 15 ml ). The combined organic layers were washed with phosphate buffer ( $\mathrm{pH}=7,10 \mathrm{ml}$ ), dried, and evaporated. The residue was filtered through flash silica ( 3 cm ) in a Pasteur pipette using dichloromethane/ether ( $1: 1$ ) as eluant. The filtrate was evaporated to give the dialdehyde $10(88 \mathrm{mg}, 91 \%)$ - IR ( $\mathrm{CHCl}_{3}$ ): 2990 $(\mathrm{CH}), 1720(\mathrm{~s}), 1710(\mathrm{~s}) .-{ }^{1} \mathrm{H}$ NMR ( 300 MHz ): $\delta=1.10\left(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 6 \mathrm{H}, 2 \mathrm{CH}_{3}\right.$ ), 1.19 (d, $J=7 \mathrm{~Hz}, 6 \mathrm{H}, 2 \mathrm{CH}_{3}$ ), 2.52 (ddq, $J=9.5,10.3$, and $6.7 \mathrm{~Hz}, 2 \mathrm{H}, 7-\mathrm{H}$ and $15-\mathrm{H}$ ), 2.71 (dq, $J=2.5$ and $7.0 \mathrm{~Hz}, 2 \mathrm{H}$, formylethyl $1-\mathrm{H}$ ), $5.39(\mathrm{dd}, J=2.5$ and $10.3 \mathrm{~Hz}, 2 \mathrm{H}, 8-\mathrm{H}$ and $16-\mathrm{H}), 5.57(\mathrm{~d}, J=15.4 \mathrm{~Hz}, 2 \mathrm{H}, 3-\mathrm{H}$ and $11-\mathrm{H}), 5.65(\mathrm{dd}, J=9.5$ and $15.0 \mathrm{~Hz}, 2 \mathrm{H}, 6-\mathrm{H}$ and $14-\mathrm{H}$ ), $6.05(\mathrm{dd}, J=11.2$ and $15.0 \mathrm{~Hz}, 2 \mathrm{H}, 5-\mathrm{H}$ and $13-\mathrm{H}), 6.96(\mathrm{dd}, J=11.2$ and $15.4 \mathrm{~Hz}, 2 \mathrm{H}, 4-\mathrm{H}$ and $12-\mathrm{H}$ ), 9.67 (s, $2 \mathrm{H}, 2 \mathrm{CHO}$ ). $-\mathrm{MS}: m / z=388\left(<1 \%, \mathrm{M}^{+}\right), 194$ $\left(24 \%, \mathrm{M}^{+} / 2\right), 177\left(100 \%, \mathrm{M}^{+} / 2-\mathrm{OH}\right), 165\left(42 \%, \mathrm{M}^{+} / 2-\mathrm{CHO}\right)$.
Ethyl ( $2 R, 3 R$ )-2-ethyl-3-hydroxybutanoate (29): $n$-Butyllithium ( $240 \mathrm{ml}, 1.35 \mathrm{~N}$ solution in hexane; 324 mmol ) was added dropwise to a stirred solution of diisopropylamine ( 56 ml , 395 mmol ) in THF ( 350 ml ) at $-50^{\circ} \mathrm{C}$. The mixture was stirred for 15 min and a solution of ethyl $(R)$-3-hydroxybutanoate ( $17.8 \mathrm{~g}, 135 \mathrm{mmol}$ ) in THF ( 40 ml ) was added over 30 min at $-40^{\circ} \mathrm{C}$. The mixture was stirred at $-20^{\circ} \mathrm{C}$ for 3.5 h and then cooled to $-78^{\circ} \mathrm{C}$. A solution of ethyl iodide ( $40.4 \mathrm{ml}, 500 \mathrm{mmol}$ ) in THF ( 20 ml ) was added over a period of 20 min and the mixture stirred at $-78^{\circ} \mathrm{C}$ for 8 h . The solution was then warmed to $20^{\circ} \mathrm{C}$ over a period of 6 h and stirred for another 5 h at $20^{\circ} \mathrm{C}$. The mixture was quenched with saturated ammonium chloride solution ( 100 ml ) and extracted with ether/hexane ( $1: 1,2 \times$ 100 ml ). The combined organic extracts were washed with saturated ammonium chloride solution ( 50 ml ), dried, filtered, and evaporated to give an oil which was purified by distillation to give $29(18.1 \mathrm{~g}, 84 \%)$. - B. p. $83-86^{\circ} \mathrm{C} / 12 \mathrm{Torr}$; $[\alpha]_{\mathrm{D}}=-6.1(c=1.0)$. - IR $\left(\mathrm{CHCl}_{3}\right): 3620-3350(\mathrm{O}-\mathrm{H}), 1714(\mathrm{C}=\mathrm{O}) .-{ }^{1} \mathrm{H}$ NMR ( 300 MHz ): $\delta=0.93(\mathrm{t}, J=$ $\left.7.4 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CCH}_{2} \mathrm{CH}_{3}\right), 1.22\left(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3} \mathrm{CH}\right), 1.28\left(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, $1.62-1.78\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CCH}_{2} \mathrm{Me}\right.$ ), 2.30 (dt, $J=8.4$ and $6.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CHCO}_{2}$ ), $2.56-2.686^{*}$ (br., $1 \mathrm{H}, \mathrm{OH}$ ), 3.92 (quint, $J=6.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CHOH}$ ), 4.19 (q, $J=7.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{OCH}_{2}$ ). ${ }^{13} \mathrm{C}$ NMR: $\delta=11.8,14.4,21.2,22.2,55.1,60.3,68.3,175.2 .-\mathrm{MS}: m / z=145\left(7 \%, \mathrm{M}^{+}-\right.$ Me), $131\left(1 \%, \mathrm{M}^{+}-\mathrm{Et}\right), 116\left(72 \%, \mathrm{M}^{+}-\mathrm{MeCHO}\right), 115\left(32 \%, \mathrm{M}^{+}-\mathrm{MeCHOH}\right.$ or $\left.\mathrm{M}^{+}-\mathrm{OEt}\right), 101\left(71 \%, \mathrm{M}^{+}-\mathrm{MeCHO}-\mathrm{Me}\right), 87\left(7 \%, \mathrm{M}^{+}-\mathrm{CO}_{2} \mathrm{Et}\right), 73\left(100 \%, \mathrm{CO}_{2} \mathrm{Et}\right)$, 45 ( $58 \%$, MeCHOH).

(5R,6R,7R)-5-(tert-Butyldimethylsilyloxy)-6-ethyl-7-triethylsilyloxy-3-octanone (35): A solution of titanium tetrachloride ( $5.0 \mathrm{ml}, 1.0 \mathrm{~N}$ solution in dichloromethane, 5.0 mmol ) was added dropwise to a stirred mixture of the aldehyde $32(0.96 \mathrm{~g}, 4.17 \mathrm{mmol})$ and 2 -trime-thylsilyloxy-1-butene ( 33 ) ( $1.20 \mathrm{~g}, 8.32 \mathrm{mmol}$ ) in dichloromethane ( 20 ml ) at $-78^{\circ} \mathrm{C}$. After 10 min , the mixture was poured into vigorously stirred phosphate buffer solution $(\mathrm{pH}=7$; $50 \mathrm{ml})$ and the organic layer separated. The aqueous layer was extracted with ether ( $2 \times$ 50 ml ) and the combined organic extracts were washed with phosphate buffer ( $\mathrm{pH}=7$; $30 \mathrm{ml})$. The organic solution was dried, filtered, and evaporated to give an oil which was chromatographed on silica gel ( 50 g ) eluting with ether/hexane $(1: 4)$ to give the aldol 34 ( $482 \mathrm{mg}, 38 \%, R_{\mathrm{F}}=0.18$ ) as an unstable oil. - ${ }^{1} \mathrm{H} \operatorname{NMR}(90 \mathrm{MHz}): \delta=0.61[\mathrm{q}, J=$ $\left.8 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right], 0.96\left[\mathrm{t}, J=8 \mathrm{~Hz}, 9 \mathrm{H}, \mathrm{Sil}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right], 0.80-1.18(\mathrm{~m}, 8 \mathrm{H}$, $\mathrm{CHCH}_{2} \mathrm{CH}_{3}$ and $\mathrm{COCH}_{2} \mathrm{CH}_{3}$ ), $1.28\left(\mathrm{~d}, J=7 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3} \mathrm{CH}-\mathrm{O}\right), 1.25-1.60(\mathrm{~m}, 1 \mathrm{H}$, $\mathrm{CHCH}_{2} \mathrm{Me}$ ), $2.28-2.73\left[\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}(\mathrm{C}=\mathrm{O}) \mathrm{CH}_{2}\right], 2.90-3.20^{*}(\mathrm{br} ., 1 \mathrm{H}, \mathrm{OH}), 4.09(\mathrm{dq}, \mathrm{J}=$ 4 and $7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}-\mathrm{OSi}), 4.38$ (ddd, $J=7.5$ and $2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}-\mathrm{OH}$ ).

The aldol 34 was immediately dissolved in DMF ( 10 ml ) and added in one portion to a stirred mixture of imidazole ( $450 \mathrm{mg}, 6.61 \mathrm{mmol}$ ) and tert-butyldimethylsilyl chloride $(500 \mathrm{mg}, 3.32 \mathrm{mmol})$ in DMF $(6 \mathrm{ml})$ at $0^{\circ} \mathrm{C}$. The mixture was stirred at $25^{\circ} \mathrm{C}$ for 80 h and then poured into phosphate buffer ( $\mathrm{pH}=7 ; 20 \mathrm{ml}$ ). The organic layer was separated and the aqueous phase extracted with ether/hexane ( $1: 1$ ) $(5 \times 50 \mathrm{ml})$. The combined extracts were washed with water ( 50 ml ), dried, filtered, and evaporated. The residue was chromatographed on silica gel eluting with ether/hexane $(1: 20)$ to give the silylated aldol 35 ( $287 \mathrm{mg}, 16 \%$ yield from $32 ; R_{\mathrm{F}}=0.27$ ) as an oil. A sample was kugelrohr-distilled. - B. p. $130-140^{\circ} \mathrm{C} / 0.003$ Torr; $[\alpha]_{\mathrm{D}}=+27.8(c=1.89)$. Methanolysis of $\mathbf{4 0}$ to give $\mathbf{8}$ in the presence of p-toluenesulfonic acid: A mixture of $\mathbf{4 0 a}$ $(6.5 \mathrm{mg}, 0.0053 \mathrm{mmol})$ and $p$-toluenesulfonic acid $(1.0 \mathrm{mg})$ in methanol $(1.0 \mathrm{ml})$ was stirred at $20^{\circ} \mathrm{C}$ for 30 min . TLC analysis showed no starting material left. The mixture was poured into phosphate buffer ( $\mathrm{pH}=7 ; 5 \mathrm{ml}$ ) and extracted with ether ( $2 \times 25 \mathrm{ml}$ ). The combined ethercal solvents were washed with phosphate buffer ( $\mathrm{pH}=7 ; 5 \mathrm{ml}$ ), dried, filtered, and evaporated to give an oil which was chromatographed on Merck silica gel plate ( $60 \mathrm{~F}_{254}$ ) developing with ether/hexane (3:1) to give a homogenous fraction $8 \mathbf{~ a ~} 10.7 \mathrm{mg}, 16 \% ; R_{\mathrm{F}}=$
$0.28) ;[\alpha]_{\mathrm{D}}=+86 \pm 17\left(c=0.07, \mathrm{CCl}_{4}\right)$. This compound is identical by NMR ( 300 MHz ), IR, and TLC with the sample 8 a prepared from elaiophylin.

Similar treatment of 40 b ( $3.4 \mathrm{mg}, 0.0030 \mathrm{mmol}$ ) with $p$-toluenesulfonic acid in methanol $\left(20^{\circ} \mathrm{C}, 20 \mathrm{~min}\right)$ gave $8 \mathrm{~b}\left(1.1 \mathrm{mg}, 48 \% ; R_{\mathrm{F}}=0.19\right.$, ether $/$ hexane $=3: 1$ ) as an oil. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ); (for numbering see formula at the beginning of the Experimental Part): $\delta=0.42^{*}$ (br., $6 \mathrm{H}, 4 \mathrm{OH}$ and 2 MeOH ), $0.63\left(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.72(\mathrm{~d}, J=$ $\left.6.6 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.87\left(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.87\left(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.87(\mathrm{t}$, $\left.J=7.4 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CHCH}_{2} \mathrm{CH}_{3}\right), 0.94\left(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CHCH}_{2} \mathrm{CH}_{3}\right), 1.17(\mathrm{~d}, J=5.7 \mathrm{~Hz}$, $3 \mathrm{H}, \mathrm{CH}_{3}$ ) $1.20-1.75\left(\mathrm{~m}, 6 \mathrm{H}, 2 \mathrm{CHCH}_{2} \mathrm{Me}\right), 1.23\left(\mathrm{~d}, J=6.0 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.25(\mathrm{~d}, J=$ $\left.5.9 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.30\left(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.70-1.85\left[\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}_{4 \mathrm{x}}\left(\mathrm{C}\left(3_{8}^{\prime \prime}\right)\right.\right.$ and $\left.\mathrm{H}_{\mathrm{ax}} \mathrm{C}\left(3_{16}^{\prime \prime}\right)\right], 1.90-2.06\left[\mathrm{~m}, 2 \mathrm{H}, \mathrm{HC}\left(1_{8}^{\prime}\right)\right.$ and $\left.\mathrm{HC}\left(1_{16}^{\prime}\right)\right], 2.20-2.36[\mathrm{~m}, 4 \mathrm{H}, \mathrm{HC}(7), \mathrm{HC}(15)$, $\mathrm{HC}\left(3_{8}^{\prime}\right)$ and $\left.\mathrm{H}_{\mathrm{eq}} \mathrm{C}\left(3_{16}^{\prime \prime}\right)\right], 2.50\left[\mathrm{dq}, J=1.5\right.$ and $\left.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}\left(3_{16}^{\prime}\right)\right], 2.80[\mathrm{dd}, J=13.0$ and $\left.4.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}_{\mathrm{eq}} \mathrm{C}\left(3_{8}^{\prime \prime}\right)\right], 3.07(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OMe}), 3.13(\mathrm{~s}, 6 \mathrm{H}, 2 \mathrm{MeOH}), 3.20(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OMe}), 3.44$ $\left[\mathrm{dt}, J=4.4\right.$ and $\left.10 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}\left(4_{16}^{\prime \prime}\right)\right], 3.52-3.65\left[\mathrm{~m}, 2 \mathrm{H}, \mathrm{HC}\left(4_{8}^{\prime \prime}\right)\right.$ and $\left.\mathrm{HC}\left(6_{8}^{\prime \prime}\right)\right], 3.69$ [dq, $J=10$ and $\left.6.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}\left(6_{16}^{\prime \prime}\right)\right], 3.89-3.95\left[\mathrm{~m}, 1 \mathrm{H}, \mathrm{HC}\left(2_{16}^{\prime}\right)\right], 4.11-4.17$ [m, 1 H , $\left.\mathrm{HC}\left(2_{8}^{\prime}\right)\right], 4.93[\mathrm{dd}, J=8.8$ and $1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}(16)], 5.12[\mathrm{dd}, J=10$ and $1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}(8)]$, 5.23 [dd, $J=15.2$ and $9.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}(6)], 5.36$ [dd, $J=15.1$ and $9.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}(14)$ ], $5.41[\mathrm{~d}, J=15.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}(3)], 5.50[\mathrm{~d}, J=15.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}(11)], 5.73$ [dd, $J=15.0$ and $11.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}(5)], 5.81$ [dd, $J=15.1$ and $11.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}(13)$ ], 7.05 [dd, $J=16.3$ and $11.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}(4)], 7.11[\mathrm{dd}, J=15.8$ and $11.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{HC}(12)]$.

${ }^{67)}$ The $\beta$-oxygen effect [A. C. Richardson, Carbohyd. Res. 10, 395 (1969)] may be responsible for the fact that using less good leaving groups and solvents other than HMPT gave yields of $20 \%$ or less. - It is also conceivable that too good a leaving group or too drastic conditions lead to ionisation of the $\mathrm{C}-\mathrm{O}$ bond and thus to pinacol-type rearrangements or hydride shift. - Finally, low yields may be due to competing elimination or acetal cleavage. Unpublished results by K. Lawson and R. Jakob (ETH Zürich 1982 and 1983/84, respectively).
