# 6. Implementation

## 6.1 Mapping Models to Code

## 6.2 Code Optimization

## 6.3 Refactoring

# Implementation of UML Models in Java

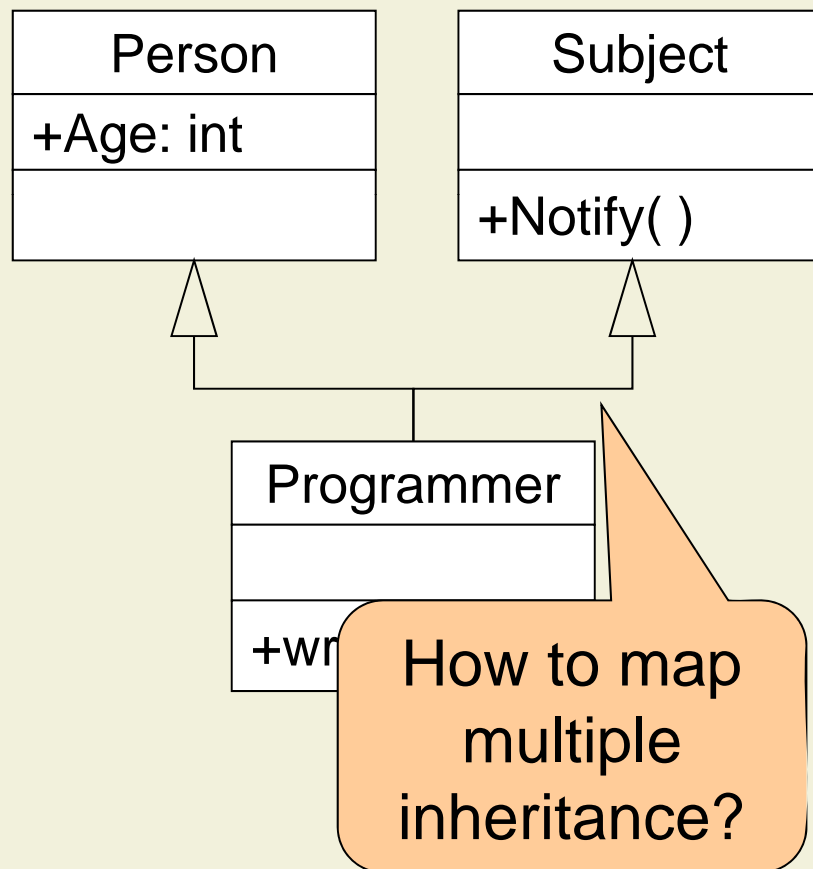

```
class Person {  
    private int age;  
  
    public void setAge( int a )  
        { age = a; }  
    public int getAge( )  
        { return age; }  
}
```

```
class Programmer extends Person {  
    public void writeCode( )  
        { ... }  
}
```

## Model-Driven Development: Idea

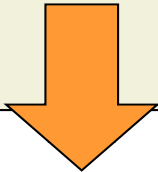

- Work on the level of design models
- **Generate code** automatically (forward engineering)
- Advantages
  - Supports many implementation platforms
  - Frees programmers from recurring activities
  - Leads to uniform code
  - Useful to enforce coding conventions (e.g., getters and setters)
  - Models are not mere documentation

# Problem: Abstraction Mismatch

- UML models may use different abstractions than the programming language
- Model should not depend on implementation language
- Models cannot always be mapped directly to code

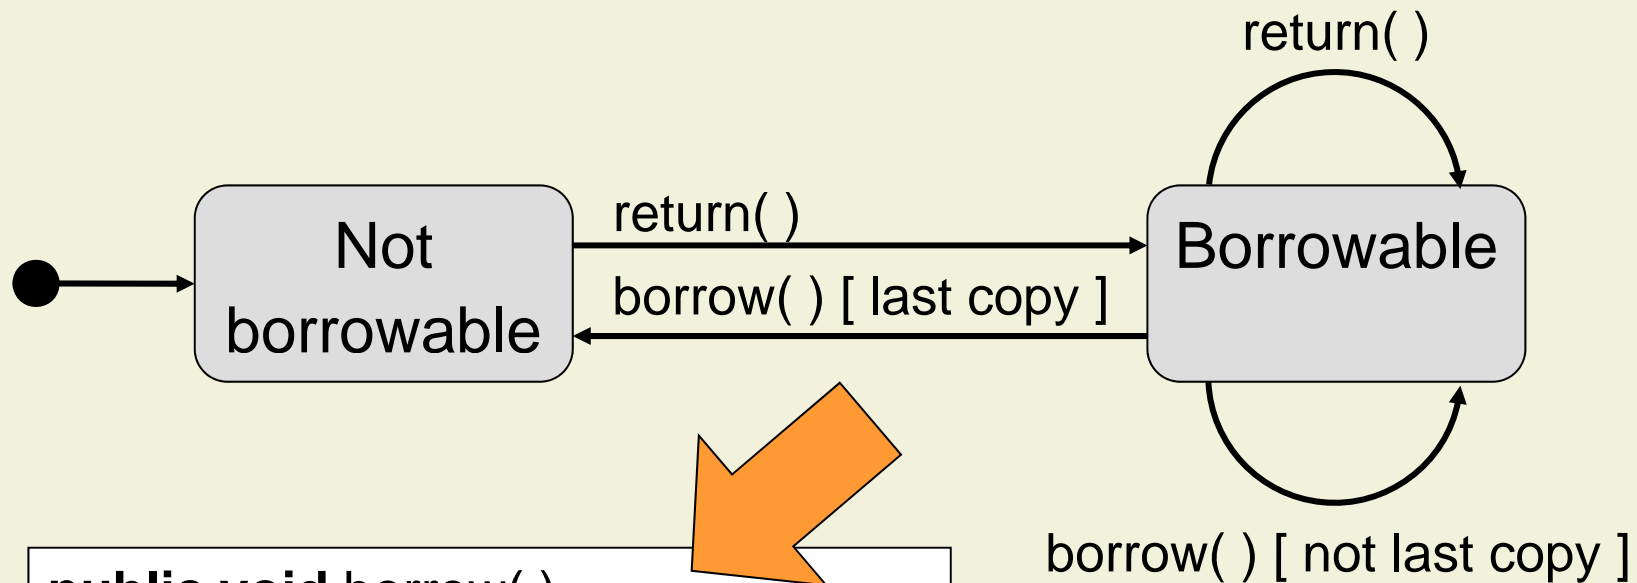

# Problem: Specifications are Incomplete

```
class Book {
    private boolean borrowable;
    public Book()
    { borrowable = false; }
    public void return()
    requires borrowable == false;
    { borrowable = true; }
    public void borrow()
    requires borrowable == true;
    { borrowable = false; }
}
```

Where is the interesting behavior?

# Problem: Specifications are Informal

**public void** borrow( )  
    requires borrowable == **true**;  
    requires "last copy" || "not last copy";  
{  
    **if** ( "last copy" ) borrowable = **false**;  
    **else** ;  
}

How to map  
informal  
specifications?

## Problem: Switching between Models and Code

- Code has to be **changed manually**
  - Add interesting behavior
  - Clarify informal specifications
  - Implement incomplete specifications
- ... or do you want to **specify the whole program behavior formally** in UML and OCL?
  - All sequence charts, state charts, etc.
- Modification of code requires complicated synchronization between code and models

# Model-Driven Development: Reality

- Model-driven development is a buzzword
- **It does not work in practice**
- Code generation works for very **basic properties**
  - Class diagrams, simple state charts
- Interesting code is still **implemented manually**
- Problems
  - Maintaining code that has no models (reverse-engineering)
  - Once code has been modified manually, going back to the model is difficult (or impossible)

### 6.3.1 Example

### 6.3.2 Discussion

# Classes and Inheritance

- Classes may be split into interfaces and implementation classes
- Attributes should be non-public
  - Generate getters and setters with appropriate visibility
- Methods are straightforward
- Inheritance can be mapped to
  - Inheritance (**extends** in Java)
  - Subtyping without inheritance (**implements** in Java)
  - Aggregation and delegation

# Unidirectional One-to-One Associations

```
public class Client {
    private Account account;
    invariant account != null;
    public Client( ) {
        account = new Account();
    }

    public Account getAccount() {
        return account;
    }
}
```

No invariant for  
0..1 association

# Bidirectional One-to-One Associations

Helps maintaining the invariant

```
public class Client {
    private final Account account;
    invariant account != null &&
        account.owner == this;
    public Client( ) {
        account = new Account( this );
    }
    public Account getAccount( ) {
        return account;
    }
}
```

```
public class Account {
    private final Client owner;
    invariant owner != null &&
        owner.account == this;
    public Account( Client owner ) {
        this.owner = owner;
    }
    public Client getOwner( ) {
        return owner;
    }
}
```

# Bidirectional One-to-Many Associations

```
public class Client {
    private final Set<Account> accounts;
    public Client( ) {
        account =
            new HashSet<Account>( );
    }
    public void add( Account a )
        requires a != null;
    {
        accounts.add( a );
        a.setOwner( this );
    }
}
```

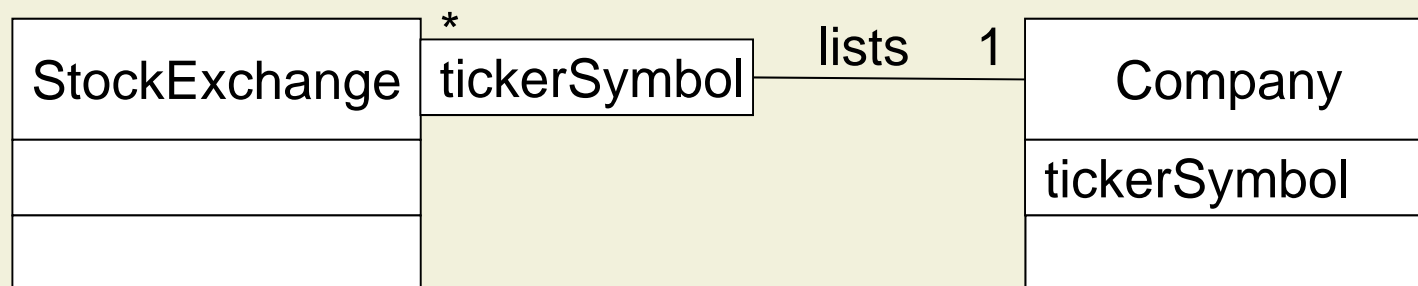

```
public class Account {
    private Client owner;
    public void setOwner( Client n )
        requires n != null;
    {
        if ( owner != n ) {
            owner.removeAccount( this );
            owner = n;
        }
    }
}
```

Invariant is a bit complicated

## Repetition: Qualified Associations

- For each ticker symbol, a stock exchange lists exactly one company

- Qualifiers reduce the multiplicity of associations

# Bidirectional Qualified Associations

```
public class StockExchange{
    private Map<String, Company> companies;

    public void addCompany( Company c )
        requires c != null && !companies.containsKey( c.tickerSymbol );
    {
        companies.put( c.tickerSymbol, c );
        c.addStockExchange( this );
    }
}
```

# 6. Implementation

## 6.1 Mapping Models to Code

6.1.1 Mapping Class Diagrams

**6.1.2 Mapping Sequence Diagrams**

6.1.3 Mapping State Diagrams

6.1.4 Mapping Contracts

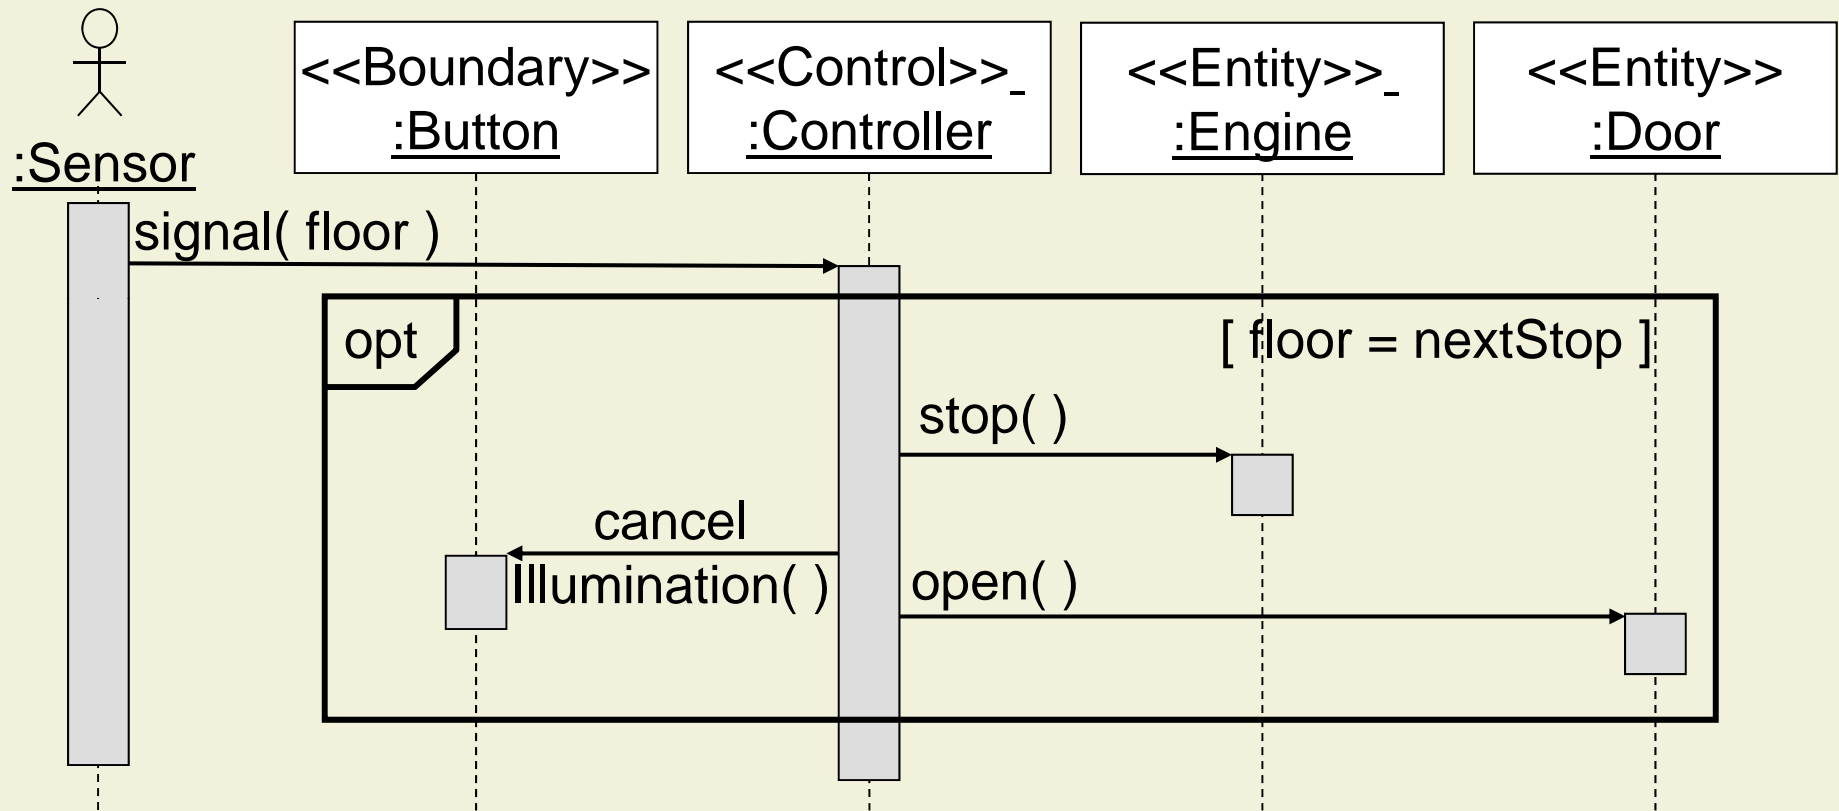

## 6.2 Code Optimization

## 6.3 Refactoring

6.3.1 Example

6.3.2 Discussion

# Sequence Diagram

# Mapping Sequence Diagrams

```
public void signal( int floor ) {  
    if ( floor == nextStop ) {  
        engine.stop( );  
        button[ floor ].cancelIllumination( );  
        door[ floor ].open( );  
    }  
}
```

opt block is  
implemented by  
conditional

Synchronous  
messages are  
implemented by  
method calls

# 6. Implementation

## 6.1 Mapping Models to Code

6.1.1 Mapping Class Diagrams

6.1.2 Mapping Sequence Diagrams

**6.1.3 Mapping State Diagrams**

6.1.4 Mapping Contracts

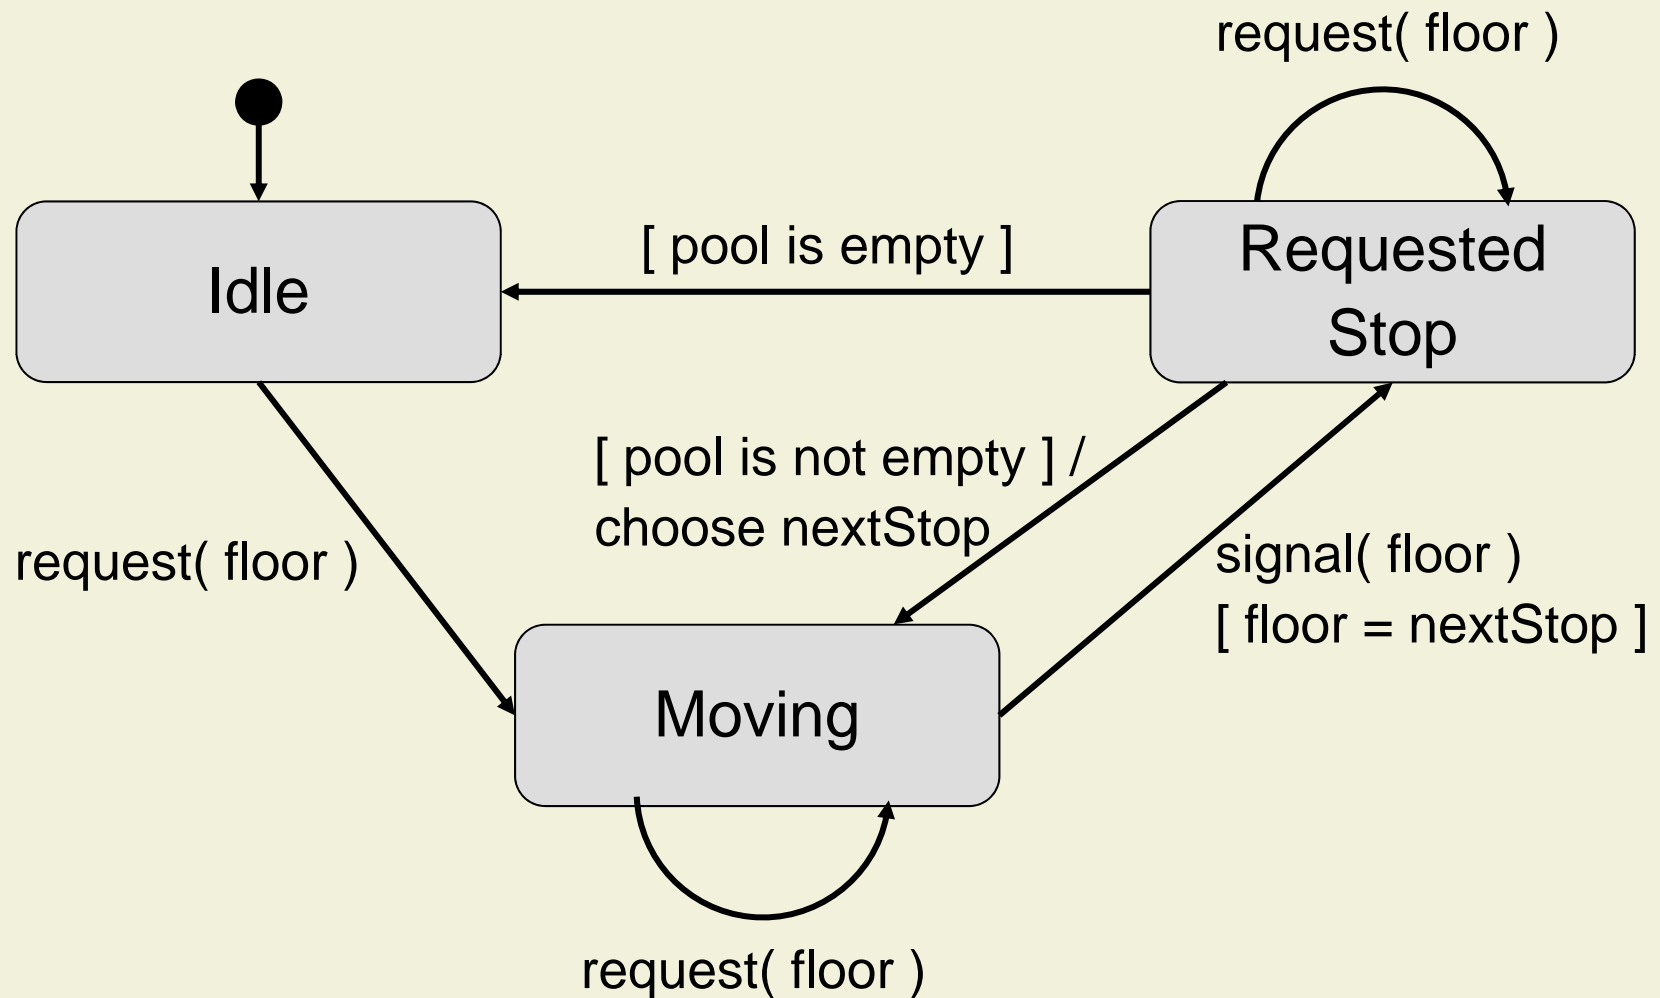

## 6.2 Code Optimization

## 6.3 Refactoring

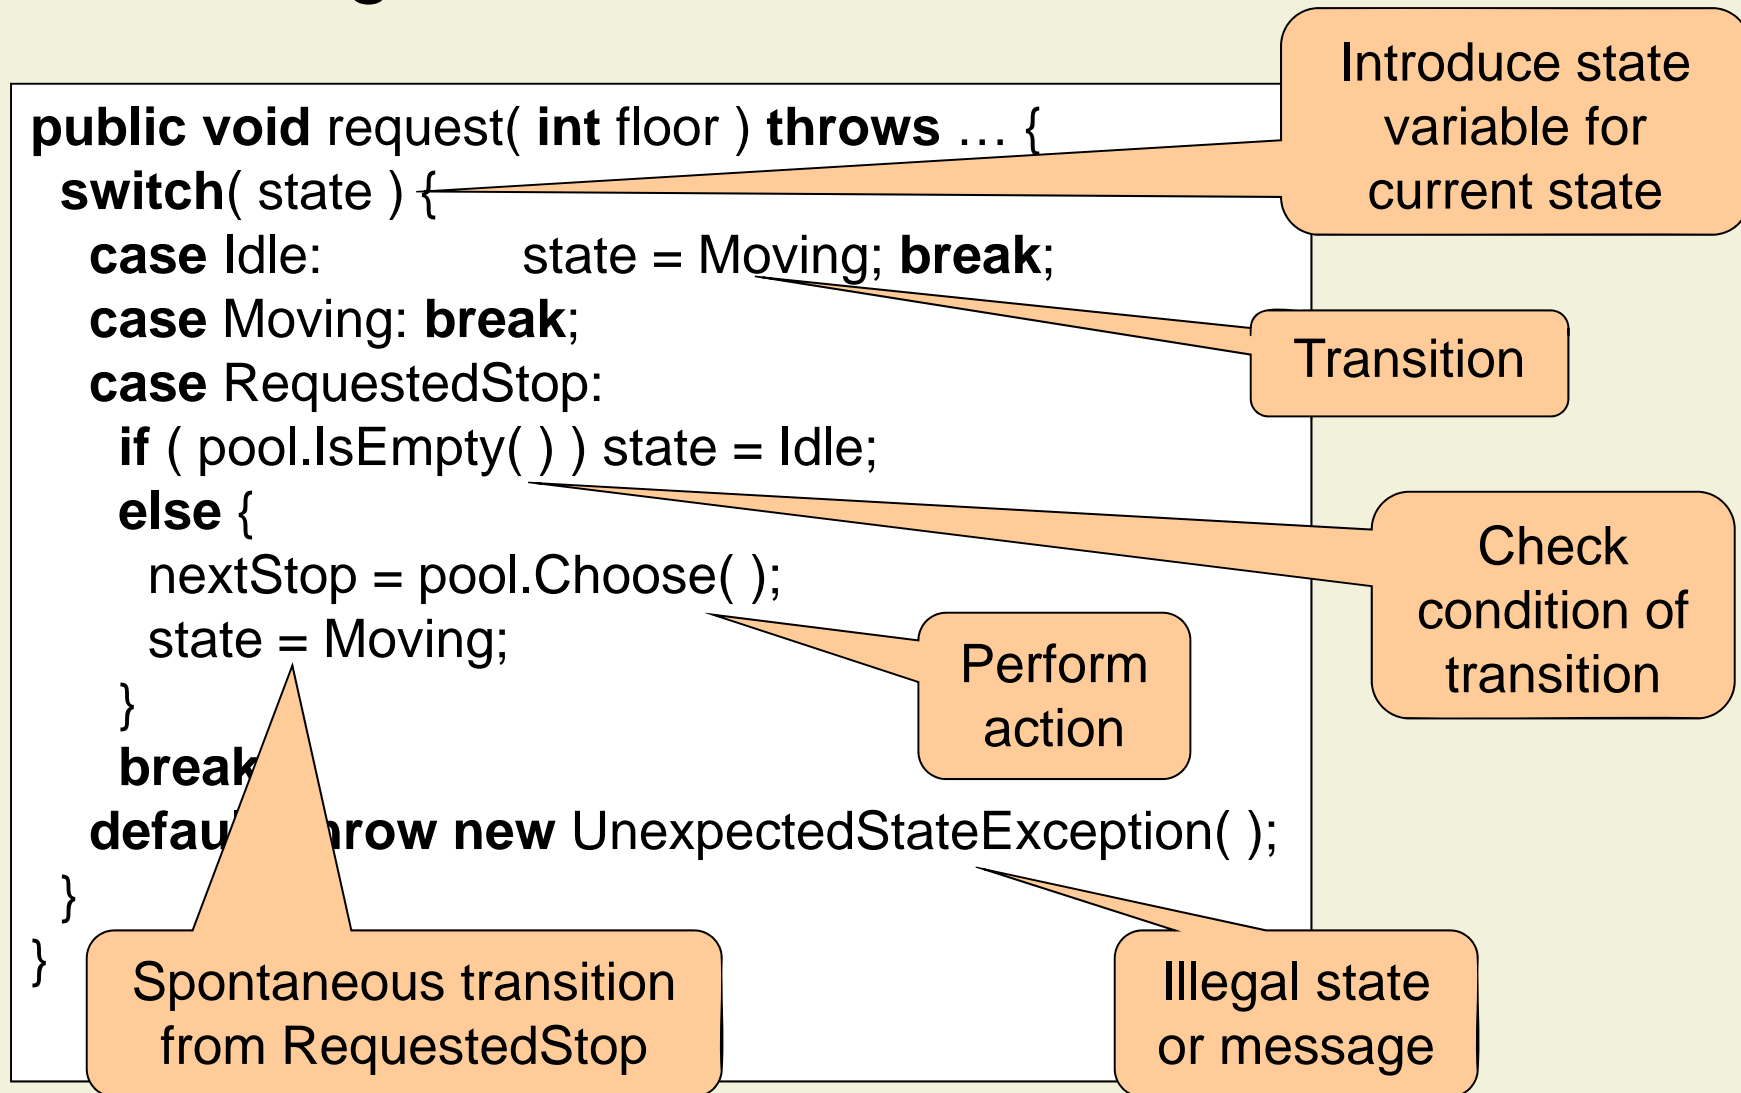

6.3.1 Example

6.3.2 Discussion

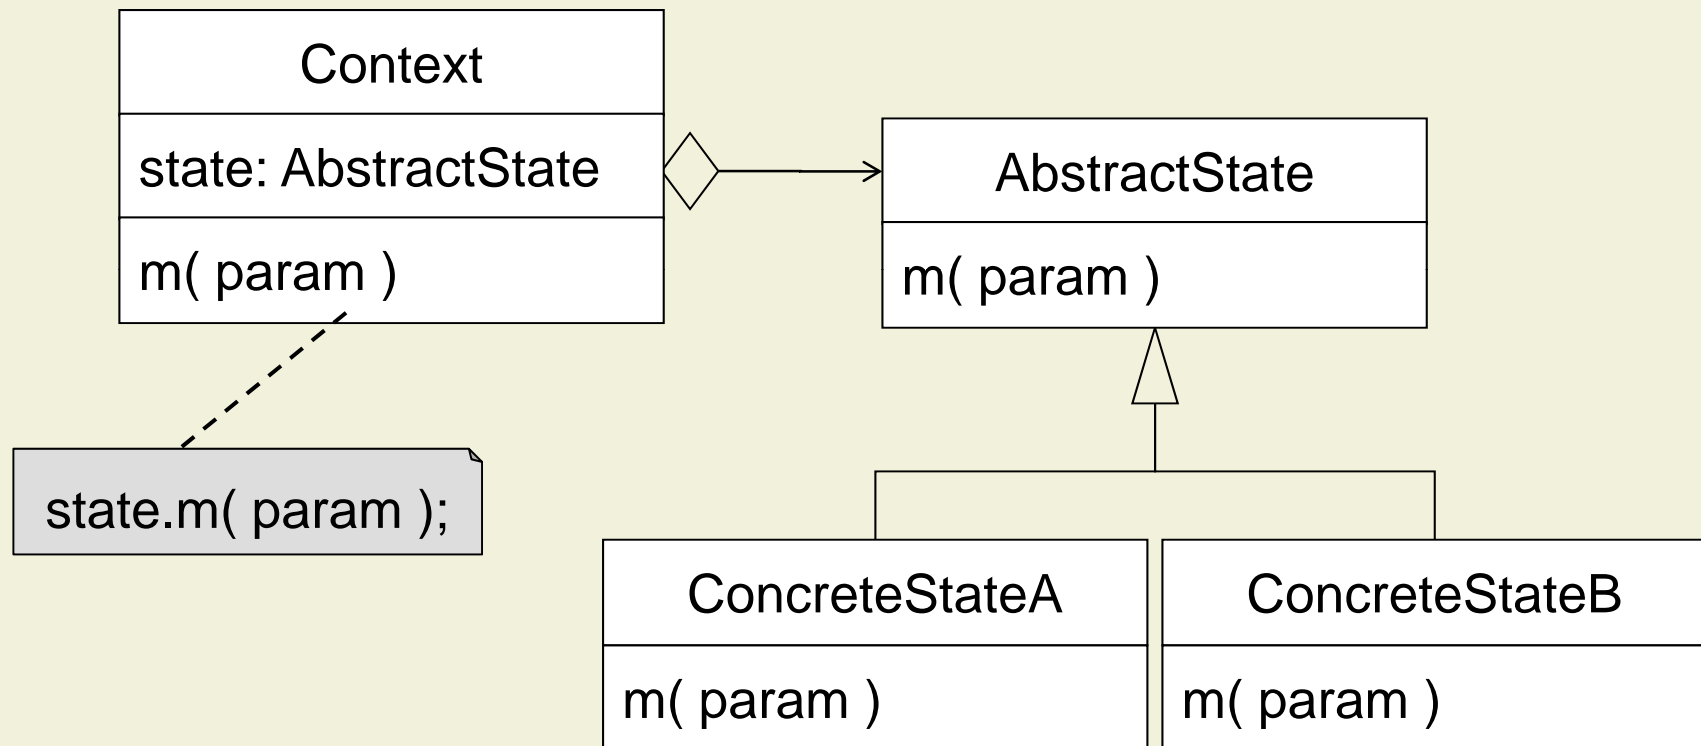

# State Diagrams

# State Diagrams to Switch Statements

# State Pattern: Structure

# State Diagrams to State Pattern

```
class IdleState extends ControllerState {  
    public void request( int floor, Controller controller ) {  
        controller.state = new MovingState( );  
    }  
}
```

**switch** statements  
replaced by dynamic  
method binding

```
class RequestedStopState extends ControllerState {  
    public void request( int floor, Controller controller ) {  
        if ( controller.pool.isEmpty( ) )  
            controller.state = new IdleState( );  
        else {  
            controller.nextStop = controller.pool.Choose( );  
            controller.state = new MovingState( );  
        }  
    }  
}
```

6.1.1 Mapping Class Diagrams

6.1.2 Mapping Sequence Diagrams

6.1.3 Mapping State Diagrams

**6.1.4 Mapping Contracts**

## 6.2 Code Optimization

## 6.3 Refactoring

6.3.1 Example

6.3.2 Discussion

# Mapping Contracts

- Many object-oriented languages do not include built-in support for contracts
  - But there are research compilers for JML, Spec#, etc.
- Possible workaround mechanisms
  - Assert statements (e.g., Java 5)
  - Conditionals plus exceptions
- Keep the contracts in the source code, not in the design model
  - More likely to be updated when source code changes

# Implementing a Contract

- Check precondition
  - Before the beginning of the method
  - Throw exception if the precondition is false
- Check postcondition
  - At the end of the method
  - Throw exception if the postcondition is false
- Check invariant
  - At the same time as postconditions
- Deal with inheritance
  - Put checking code into separate methods that can be called from subclasses

# Mapping Contracts: Examples

```
void add( Account a )  
  requires a != null;  
{  
  accounts.add( a );  
  a.setOwner( this );  
}
```

<<precondition>>  
a != null

```
void add( Account a )  
{  
  assert a != null;  
  accounts.add( a );  
  a.setOwner( this );  
}
```

```
void add( Account a )  
{  
  if ( a == null )  
    throw new IllegalArgumentException( );  
  accounts.add( a );  
  a.setOwner( this );  
}
```

# Heuristics for Implementing Contracts

- Be pragmatic, if you don't have enough time, change your tests in the following order
- Omit checking code for postconditions and invariants
  - Often redundant, if you are confident that the code accomplishes the functionality of the method
  - Not likely to detect many bugs unless written by a separate tester
- Omit the checking code for private and protected methods

# 6. Implementation

6.1.3 Mapping State Diagrams

6.1.4 Mapping Contracts

## 6.2 Code Optimization

## 6.3 Refactoring

6.3.1 Example

6.3.2 Discussion

# Quality Characteristics and Performance

- Performance is most important non-functional requirement, but:
- *“More computing sins are committed in the name of efficiency (without necessarily achieving it) than for any other single reason – including blind stupidity.”*  
[W. A. Wulf]
- *“Premature optimization is the root of all evil.”*  
[D. Knuth]

# Design for Performance

- A **simple design** is likely to be both correct and fast
  - Use efficient algorithms
- **Avoid** inherently **expensive operations** whenever possible
  - System calls
  - Synchronization
  - Network message exchanges
  - Disk accesses (use buffered I/O)
  - Memory allocation and copying (use flyweight pattern)

# Premature Optimization

- Jackson's Rules of Optimization:

*Rule 1. Don't do it.*

*Rule 2. (for experts only) Don't do it yet.*

[M. A. Jackson]

- After creating a performance-aware design, forget all about efficiency until testing is completed
- During implementation, **focus on clarity and correctness**, not on performance

# Performance Tuning

- Performance tuning of a working program

- Space versus time
  - The usual performance objective is maximum speed in a reasonable amount of space

# Performance Tuning: Myths

- Reducing the lines of source code improves performance of machine code
  - No predictable relationship between number of lines of source code and ultimate performance
- Certain operations are faster or smaller than others
  - Performance varies significantly depending on the language, choice of compiler, libraries, operating system, hardware (especially CPU), amount of memory, etc.
  - The only way to reliably determine what is smaller or faster is to measure

## Performance Tuning: Myths (cont'd)

- You should optimize as you go
  - Other qualities are usually more important and harder to fix later
  - It is very hard to correctly identify bottlenecks during coding
  
- A fast program is just as important as a correct one
  - Without correctness, speed is meaningless

# 6. Implementation

## 6.1 Mapping Models to Code

## 6.2 Code Optimization

## 6.3 Refactoring

### 6.3.1 Example

### 6.3.2 Discussion

# Refactoring: Definition

- Refactoring (noun):

*A change made to the internal structure of software to make it*

- *Easier to understand and*
- *Cheaper to modify*
- *Without changing its observable behavior*

- Refactor (verb):

*To restructure software by applying a series of refactorings*

## Refactoring: Example

- “a program to calculate and print a statement of a customer’s charges at a video store”
  - Price depends on how long the movie is rented and the category of the movie
  - Also compute frequent renter points
- Initial class diagram

# Movie Class

```
public class Movie {  
    public static final int REGULARS=0;  
    public static final int NEW_RELEASE=1;  
    public static final int CHILDREN=2;  
  
    private String _title;  
    private int _priceCode;  
  
    public Movie( String title, int priceCode ) {  
        _title = title; _priceCode = priceCode;  
    }  
    public int getPriceCode( )           { return _priceCode; }  
    public void setPriceCode( int arg ) { _priceCode = arg; }  
    public String getTitle( )           { return _title; }  
}
```

## Rental and Customer Class

```
public class Rental {  
    private Movie _movie; private int _daysRented;  
    public Rental( Movie movie, int daysRented ) {  
        _movie = movie; _daysRented = daysRented;  
    }  
    public int getDaysRented( )    { return _daysRented; }  
    public Movie getMovie( )      { return _movie; }  
}
```

```
public class Customer {  
    private String _name;  
    private Vector _rentals = new Vector( );  
    public Customer( String name )    { _name = name; }  
    public void addRental( Rental arg ) { _rentals.addElement( arg ); }  
    public String getName( )          { return _name; }  
    ...  
}
```

## Customer.statement Method

```
public String statement( ) {  
    double totalAmount = 0;  
    int frequentRenterPoints = 0;  
    Enumeration rentals = _rental.elements( );  
    String result = "Rental Record for " + getName( ) + "\n";  
    while ( rentals.hasMoreElements( ) ) {  
        double thisAmount = 0;  
        Rental each = ( Rental ) rentals.nextElement( );  
  
        // determine amounts for each line  
        switch ( each.getMovie( ).getPriceCode( ) ) {  
            case Movie.REGULAR:  
                thisAmount += 2;  
                if ( each.getDaysRented( ) > 2 )  
                    thisAmount += ( each.getDaysRented( ) - 2 ) * 1.5;  
                break;
```

## Customer.statement Method (cont'd)

```
case Movie.NEW_RELEASE:
    thisAmount += each.getDaysRented( ) * 3;
    break;
case Movie.CHILDREN:
    thisAmount += 1.5;
    if ( each.getDaysRented( ) > 3 )
        thisAmount += ( each.getDaysRented( ) – 3 ) * 1.5;
    break;
} /* switch */

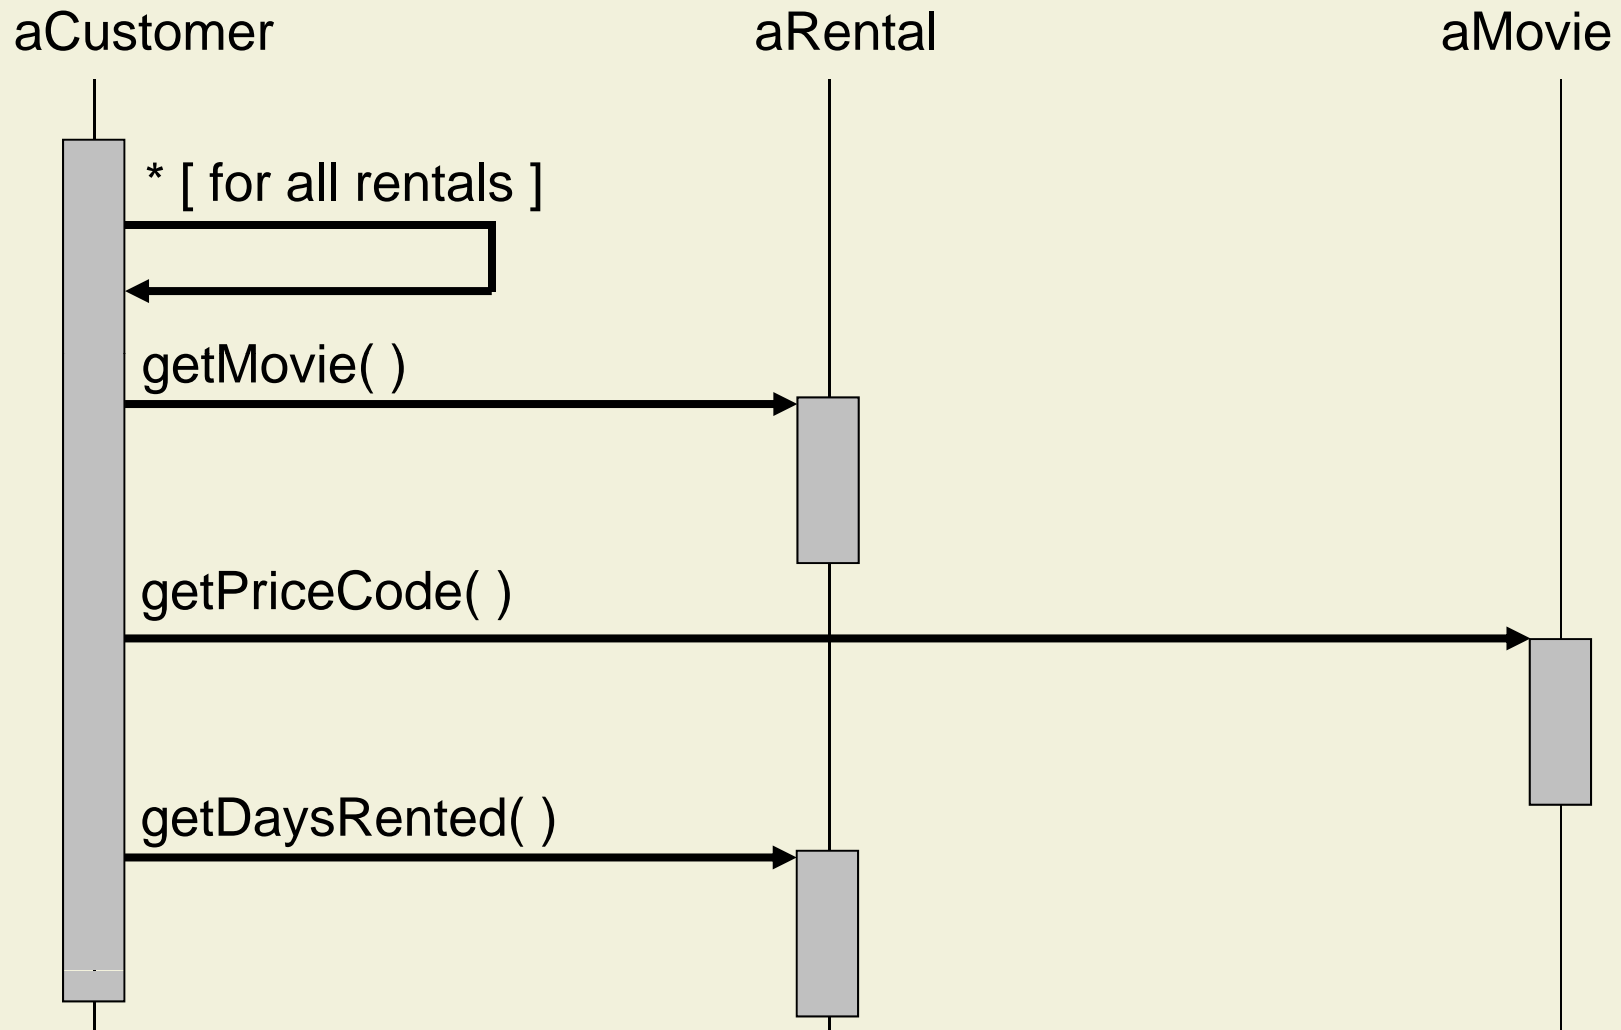

// add frequent renter points
frequentRenterPoints++;
// add bonus for a two day new release rental
if ( ( each.getMovie( ).getPriceCode( ) == Movie.NEW_RELEASE ) &&
    each.getDaysRented( ) > 1 )
    frequentRenterPoints++;
```

## Customer.statement Method (cont'd)

```
//show figures for this rental
result += "\t" + each.getMovie( ).getTitle( )+ "\t";
result += String.valueOf( thisAmount ) + "\n";
totalAmount += thisAmount;
} /* while */

// add footer lines
result += "Amount owed is "+String.valueOf( totalAmount ) + "\n";
result += "You earned " + String.valueOf( frequentRenterPoints );
result += "frequent renter points\n";
return result;
}
```

# Sequence Diagram for statement Method

# Refactoring in Action

- Refactoring: Problem Statement
  - Add an htmlStatement method which returns a customer statement string containing html tags
  - Change the way movies are classified
  - Change frequent renter points and charging
  
- Refactoring: Step 1
  - Write a test suite!
  - Refactoring should not affect the outcome of tests
  - The test suite must exercise the published interface of the classes

## Step 2: Extract Method

```
public String statement( ) {
    double totalAmount = 0;
    int frequentRenterPoints = 0;
    Enumeration rentals = _rental.elements();
    String result = "Rental Record for " + getName( ) + "\n";
    while ( rentals.hasMoreElements( ) ) {
        double thisAmount = 0;
        Rental each = ( Rental ) rentals.nextElement( );

        // determine amounts for each line
        switch ( each.getMovie( ).getPriceCode( ) ) {
            case Movie.REGULAR:
                thisAmount += 2;
                if ( each.getDaysRented( ) > 2 )
                    thisAmount += ( each.getDaysRented( ) - 2 ) * 1.5;
                break;
            case Movie.NEW_RELEASE:
                thisAmount += each.getDaysRented( ) * 3;
                break;
            case Movie.CHILDREN:
                thisAmount += 1.5;
                if ( each.getDaysRented( ) > 3 )
                    thisAmount += ( each.getDaysRented( ) - 3 ) * 1.5;
                break;
        } /* switch */
    }
}
```

Method is  
overly long

```
        frequentRenterPoints += each.getDaysRented( );
        // add bonus for a two day new release rental
        if ( ( each.getMovie( ).getPriceCode( ) ==
            Movie.NEW_RELEASE ) &&
            each.getDaysRented( ) > 1 )
            frequentRenterPoints++;
        //show figures for this rental
        result += "\t" + each.getMovie( ).getTitle( ) + "\t";
        result += String.valueOf( thisAmount ) + "\n";
        totalAmount += thisAmount;
    } /* while */

    // add footer lines
    result += "Amount owed is " + String.valueOf( totalAmount ) +
        "\n";
    result += "You earned " + String.valueOf( frequentRenterPoints
    );
    result += "frequent renter points\n";
    return result;
}
```

Apply  
"Extract Method"

## Step 2: Extract Method (cont'd)

```
private int amountFor( Rental each ) {  
    int thisAmount = 0;  
    switch ( each.getMovie( ).getPriceCode( ) ) {  
        case Movie.REGULAR:  
            thisAmount += 2;  
            if ( each.getDaysRented( ) > 2 )  
                thisAmount += ( each.getDaysRented( ) - 2 ) * 1.5;  
            break;  
        case Movie.NEW_RELEASE:  
            thisAmount += each.getDaysRented( ) * 3;  
            break;  
        case Movie.CHILDREN:  
            thisAmount += 1.5;  
            if ( each.getDaysRented( ) > 3 )  
                thisAmount += ( each.getDaysRented( ) - 3 ) * 1.5;  
            break;  
    } /* switch */  
    return thisAmount;  
}
```

Local variable  
becomes  
parameter

Local variable  
becomes result

## Step 2: Extract Method (cont'd)

```
public String statement( ) {
    double totalAmount = 0;
    int frequentRenterPoints = 0;
    Enumeration rentals = _rental.elements( );
    String result = "Rental Record for " + getName( ) + "\n";
    while ( rentals.hasMoreElements( ) ) {
        double thisAmount = 0;
        Rental each = ( Rental ) rentals.nextElement( );

        // determine amounts for each line
        thisAmount = amountFor( each );
```

```
        // add frequent renter points
        frequentRenterPoints++;
        // add bonus for a two day new release rental
        if ( ( each.getMovie( ).getPriceCode( ) ==
            Movie.NEW_RELEASE ) &&
            each.getDaysRented( ) > 1 )
            frequentRenterPoints++;
        //show figures for this rental
        result += "\t" + each.getMovie( ).getTitle( ) + "\t";
        result += String.valueOf( thisAmount ) + "\n";
        totalAmount += thisAmount;
    } /* while */

    // add footer lines
    result += "Amount owed is " + String.valueOf( totalAmount ) +
        "\n";
    result += "You earned " + String.valueOf( frequentRenterPoints
    );
    result += "frequent renter points\n";
    return result;
}
```

## Step 3: Test

```
private double amountFor( Rental each ) {  
    double thisAmount = 0;  
    switch ( each.getMovie( ).getPriceCode( ) ) {  
        case Movie.REGULAR:  
            thisAmount += 2;  
            if ( each.getDaysRented( ) > 2 )  
                thisAmount += ( each.getDaysRented( ) - 2 ) * 1.5;  
            break;  
        case Movie.NEW_RELEASE:  
            thisAmount += each.getDaysRented( ) * 3;  
            break;  
        case Movie.CHILDREN:  
            thisAmount += 1.5;  
            if ( each.getDaysRented( ) > 3 )  
                thisAmount += ( each.getDaysRented( ) - 3 ) * 1.5;  
            break;  
    } /* switch */  
    return thisAmount;  
}
```

Oops, there  
is a bug

Variable names  
not helpful

## Step 4: Rename Local

```
private double amountFor( Rental aRental ) {  
    double result = 0;  
    switch ( aRental.getMovie( ).getPriceCode( ) )  
        case Movie.REGULAR:  
            result += 2;  
            if ( aRental.getDaysRented( ) > 2 )  
                result += ( aRental.getDaysRented( ) - 2 ) * 1.5;  
            break;  
        case Movie.NEW_RELEASE:  
            result += aRental.getDaysRented( ) * 3;  
            break;  
        case Movie.CHILDREN:  
            result += 1.5;  
            if ( aRental.getDaysRented( ) > 3 )  
                result += ( aRental.getDaysRented( ) - 3 ) * 1.5;  
            break;  
    } /* switch */  
    return result;  
}
```

Method does not  
use data from  
Customer

## Step 5: Move Method

```
class Rental {  
  public double getCharge( ) {  
    double result = 0;  
    switch ( this.getMovie( ).getPriceCode( ) ) {  
      case Movie.REGULAR:  
        result += 2;  
        if ( this.getDaysRented( ) > 2 ) result += ( this.getDaysRented( ) – 2 ) * 1.5;  
        break;  
      case Movie.NEW_RELEASE:  
        result += this.getDaysRented( ) * 3;  
        break;  
      case Movie.CHILDREN:  
        result += 1.5;  
        if ( this.getDaysRented( ) > 3 ) result += ( this.getDaysRented( ) – 3 ) * 1.5;  
        break;  
    } /* switch */  
    return result;  
  }  
  ...  
}
```

Make sure super-  
and subclasses do  
not contain a  
getCharge method

Adapt  
references  
to data

## Step 5: Move Method (cont'd)

```
class Customer {  
    private double amountFor( Rental aRental ) {  
        return aRental.getCharge( );  
    }  
    ...  
}
```

Delegate  
calls to new  
method

Useless  
method

```
public String statement() {
    double totalAmount = 0;
    int frequentRenterPoints = 0;
    Enumeration rentals = _rental.elements();
    String result = "Rental Record for " +
        getName() + "\n";
    while ( rentals.hasMoreElements() ) {
        double thisAmount = 0;
        Rental each =
            ( Rental ) rentals.nextElement();
```

```
// add frequent renter points
frequentRenterPoints++;
```

Make sure method  
is not dynamically-  
bound

# Replace all calls and remove method

```
// add bonus for a two day new release rental
if ( ( each.getMovie( ).getPriceCode( ) ==
      Movie.NEW_RELEASE ) &&
      each.getRentalPeriod( ) > 1 )
    // make sure method is not dynamically-
    // bound
    totalAmount += each.getMovie( ).getTitle( ) +
                    "late fee: 1 dollar\n";
totalAmount += thisAmount;
} /* while */
```

and remove method

```
    result += "frequent renter points\n";  
    return result;
```

## Step 7: Replace Temp with Query

```
public String statement( ) {  
    double totalAmount = 0;  
    int frequentRenterPoints = 0;  
    Enumeration rentals = _rental.elements();  
    String result = "Rental Record for " +  
        getName( ) + "\n";  
    while ( rentals.hasMoreElements( ) ) {  
        Rental each =  
            ( Rental ) rentals.nextElement( );  
  
        // add frequent renter points  
        frequentRenterPoints++;  
        // add bonus for a two day new release  
        if ( ( each.getMovie( ).getPriceCode( ) ==  
            Movie.NEW_RELEASE ) &&  
            each.getDaysRented( ) > 1 )  
            frequentRenterPoints++;  
    }
```

```
        //show figures for this rental  
        result += "\t"+each.getMovie( ).getTitle( )+"\t";  
        result += String.valueOf( each.getCharge( ) )  
        + "\n";  
        totalAmount += each.getCharge( );  
    } /* while */  
  
    // add footer lines  
    result += "Amount owed is "+String.valueOf(  
        totalAmount ) + "\n";  
    result += "You earned " + String.valueOf(  
        frequentRenterPoints );  
    result += "frequent renter points\n";  
    return result;  
}
```

Frequent renter  
bonus is a separate  
computation

## Step 8: Extract Method

```
public class Rental {  
    public int getFrequentRenterPoints( ) {  
        if ( ( this.getMovie( ).getPriceCode( ) == Movie.NEW_RELEASE ) &&  
            this.getDaysRented( ) > 1 )  
            return 2;  
        else  
            return 1;  
    }  
    ...  
}
```

## Step 8: Extract Method (cont'd)

```
public String statement( ) {  
    double totalAmount = 0;  
    int frequentRenterPoints = 0;  
    Enumeration rentals = _rental.elements();  
    String result = "Rental Record for " +  
        getName( ) + "\n";  
    while ( rentals.hasMoreElements( ) ) {  
        Rental each = ( Rental )  
            rentals.nextElement( );  
  
        // add frequent renter points  
        frequentRenterPoints +=  
            each.getFrequentRenterPoints();  
    }  
}
```

```
    //show figures for this rental  
    result += "\t"+each.getMovie( ).getTitle( )+"\t";  
    result += String.valueOf( each.getCharge( ) )  
    + "\n";  
    totalAmount += each.getCharge( );  
} /* while */  
  
// add footer lines  
result += "Amount owed is "+String.valueOf(  
totalAmount ) + "\n";  
result += "You earned " + String.valueOf(  
frequentRenterPoints );  
result += "frequent renter points\n";  
return result;
```

Local variables  
clutter up code

## Step 9: Replace Temp with Query

```
class Customer {  
  private double getTotalCharge( ) {  
    double result = 0;  
    Enumeration rentals = _rentals.elements( );  
    while ( rentals.hasMoreElements( ) ) {  
      Rental each = ( Rental ) rentals.nextElement( );  
      result += each.getCharge( );  
    }  
    return result;  
  }  
  ...  
}
```

## Step 9: Replace Temp with Query (cont'd)

```
public String statement( ) {  
    int frequentRenterPoints = 0;  
    Enumeration rentals = _rental.elements();  
    String result = "Rental Record for " +  
        getName( ) + "\n";  
    while ( rentals.hasMoreElements( ) ) {  
        Rental each = ( Rental )  
            rentals.nextElement( );  
  
        // add frequent renter points  
        frequentRenterPoints +=  
            each.getFrequentRenterPoints();  
    }  
}
```

```
        //show figures for this rental  
        result += "\t"+each.getMovie( ).getTitle( )+"\t";  
        result += String.valueOf( each.getCharge( ) )  
        + "\n";  
    } /* while */  
  
    // add footer lines  
    result += "Amount owed is "+String.valueOf(  
        getTotalCharge( ) ) + "\n";  
    result += "You earned " + String.valueOf(  
        frequentRenterPoints );  
    result += "frequent renter points\n";  
    return result;  
}
```

Local variables  
clutter up code

## Step 10: Replace Temp with Query

```
class Customer {  
  private int getTotalRenterPoints( ) {  
    int result = 0;  
    Enumeration rentals = _rentals.elements( );  
    while ( rentals.hasMoreElements( ) ) {  
      Rental each = ( Rental ) rentals.nextElement( );  
      result += each.getFrequentRenterPoints( );  
    }  
    return result;  
  }  
  ...  
}
```

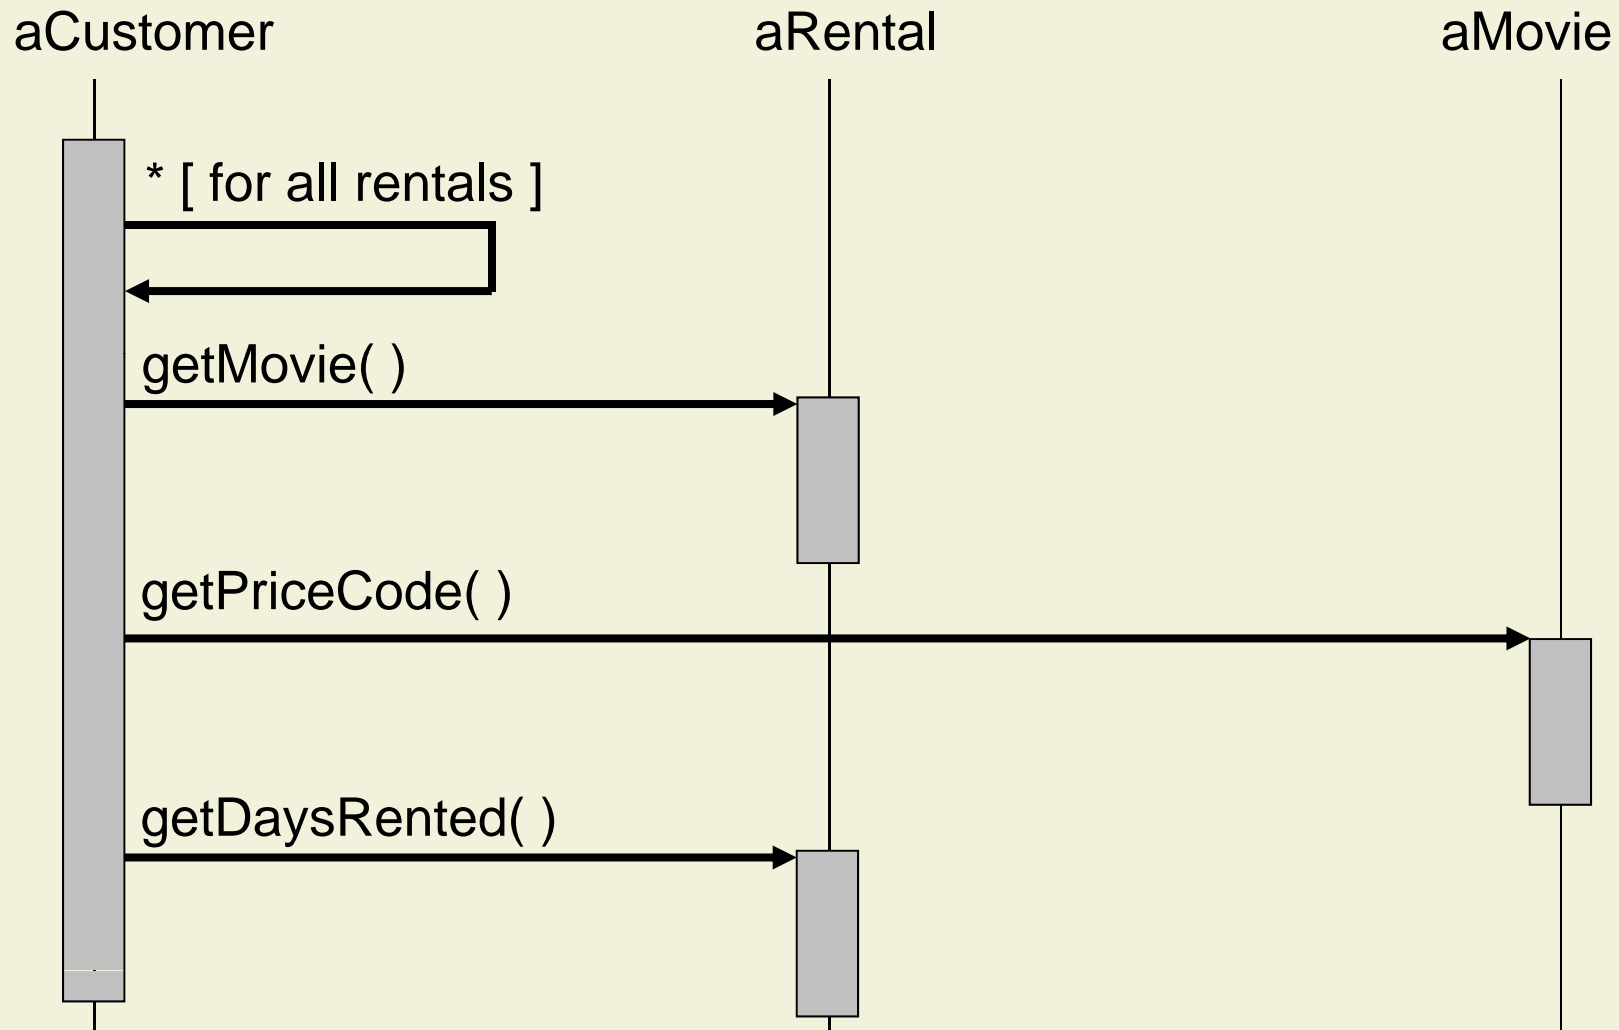

## Step 10: Replace Temp with Query (cont'd)

```
public String statement( ) {
    Enumeration rentals = _rental.elements();
    String result = "Rental Record for " +
        getName( ) + "\n";
    while ( rentals.hasMoreElements( ) ) {
        Rental each = ( Rental )
            rentals.nextElement( );

        //show figures for this rental
        result += "\t"+each.getMovie( ).getTitle(
        )+"\t";
        result += String.valueOf(
        each.getCharge( ) ) + "\n";
    } /* while */
}
```

```
// add footer lines
result += "Amount owed is "+String.valueOf(
getTotalCharge( ) ) + "\n";
result += "You earned " + String.valueOf(
getTotalRenterPoints( ) );
result += "frequent renter points\n";
return result;
}
```

# Initial Sequence Diagram for statement Method

# Revised Sequence Diagram for statement

# Observations

- Most refactorings reduce code size, but this is not necessarily the case
  - The point is to make code easier to modify and more readable
  
- Performance suffers by running the same loop three times, or does it?
  - Profile the program and find the answer

# Making Changes

```
class Customer {  
  public String htmlStatement( ) {  
    Enumeration rentals = _rental.elements();  
    String result = "<H1>Rental Record for<EM> " + getName( ) + "<EM></H1><P>\n";  
    while ( rentals.hasMoreElements( ) ) {  
      Rental each = ( Rental ) rentals.nextElement( );  
      //show figures for this rental  
      result += each.getMovie( ).getTitle( ) + ": ";  
      result += String.valueOf( each.getCharge( ) ) + "<BR>\n";  
    }  
    // add footer lines  
    result += "<P>Amount owed is<EM> " + String.valueOf(getTotalCharge()) + "</EM><P>\n";  
    result += "You earned<EM>" + String.valueOf( getTotalRenterPoints( ) );  
    result += "</EM> frequent renter points<P>\n";  
    return result;  
  }  
  ...  
}
```

The requested method  
can be added with  
minimal code duplication

## New Functionality

- Getting ready to change the classification of the movies in the store
- Perhaps new classification, perhaps modification to existing
- Charging and frequent renting will be affected

# Method Rental.getCharge

```
class Rental {  
  public double getCharge( ) {  
    double result = 0;  
    switch ( getMovie( ).getPriceCode( ) ) {  
      case Movie.REGULAR:  
        result += 2;  
        if ( getDaysRented( ) > 2 ) result += ( getDaysRented( ) – 2 ) * 1.5;  
        break;  
      case Movie.NEW_RELEASE:  
        result += getDaysRented( ) * 3;  
        break;  
      case Movie.CHILDREN:  
        result += 1.5;  
        if ( getDaysRented( ) > 3 ) result += ( getDaysRented( ) – 3 ) * 1.5;  
        break;  
    } /* switch */  
    return result;  
  }  
  ...  
}
```

switch makes  
extension difficult

## Step 11: Move Method

```
class Movie {  
    public double getCharge( int daysRented ) {  
        double result = 0;  
        switch ( getPriceCode( ) ) {  
            case REGULAR:  
                result += 2;  
                if ( daysRented > 2 ) result += ( daysRented - 2 ) * 1.5;  
                break;  
            case NEW_RELEASE:  
                result += daysRented * 3;  
                break;  
            case CHILDREN:  
                result += 1.5;  
                if ( daysRented > 3 ) result += ( daysRented - 3 ) * 1.5;  
                break;  
        } /* switch */  
        return result;  
    }  
    ...  
}
```

Data from  
Rental passed  
as parameter

switch works  
on data from  
Movie

## Step 11: Move Method (cont'd)

```
class Rental {  
    public double getCharge( ) {  
        return _movie.getCharge( _daysRented );  
    }  
    ...  
}
```

## Method Rental.getFrequentRenterPoints

```
public class Rental {  
    public int getFrequentRenterPoints( ) {  
        if ( ( getMovie( ).getPriceCode( ) == Movie.NEW_RELEASE ) &&  
            getDaysRented( ) > 1 )  
            return 2;  
        else  
            return 1;  
    }  
    ...  
}
```

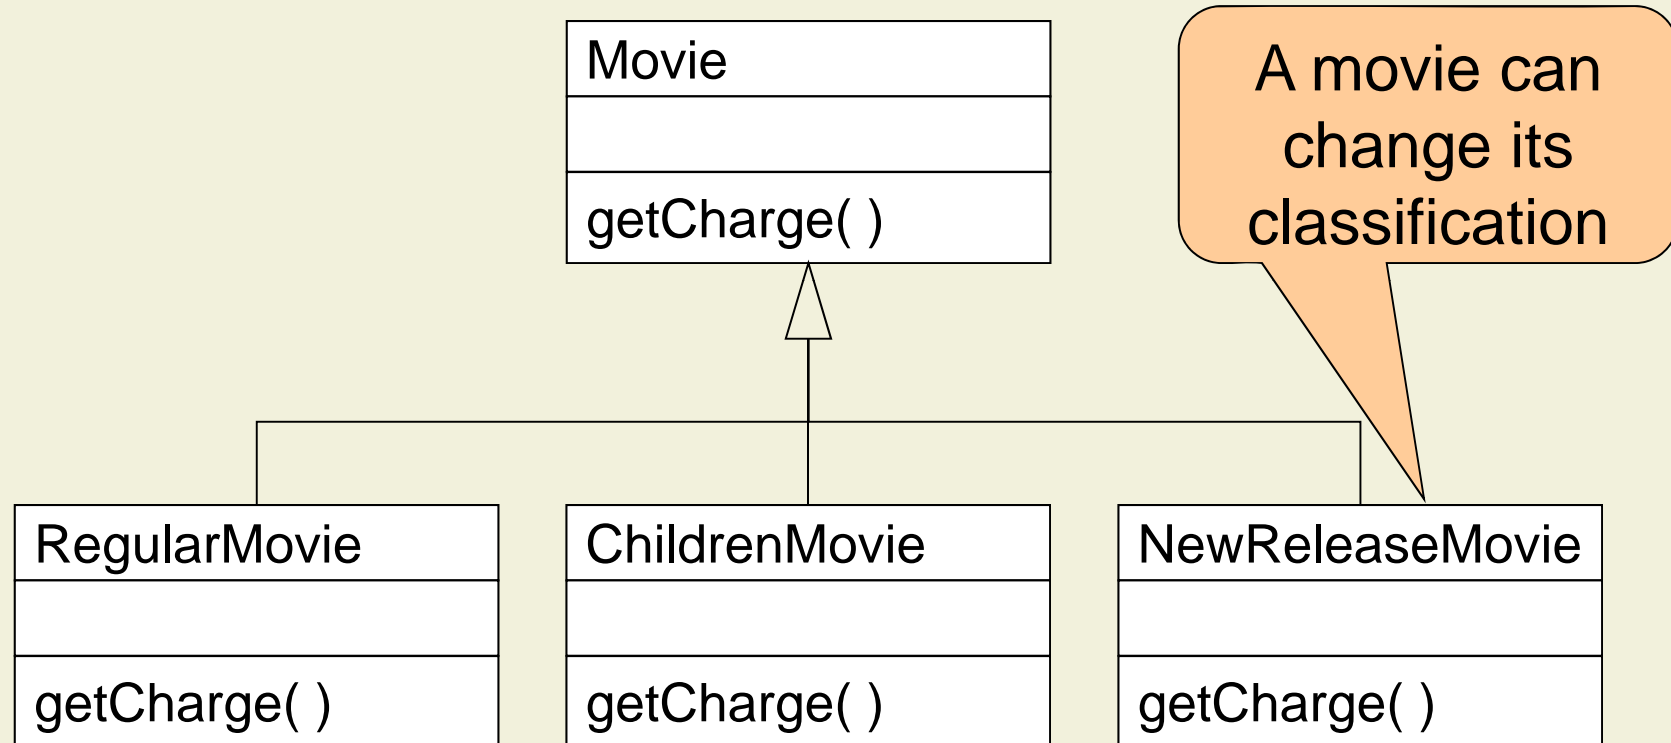

Works on data  
from Movie

## Step 12: Move Method

```
public class Movie {  
    public int getFrequentRenterPoints( int daysRented ) {  
        if ( getPriceCode( ) == NEW_RELEASE && daysRented > 1 )  
            return 2;  
        else  
            return 1;  
    }  
    ...  
}
```

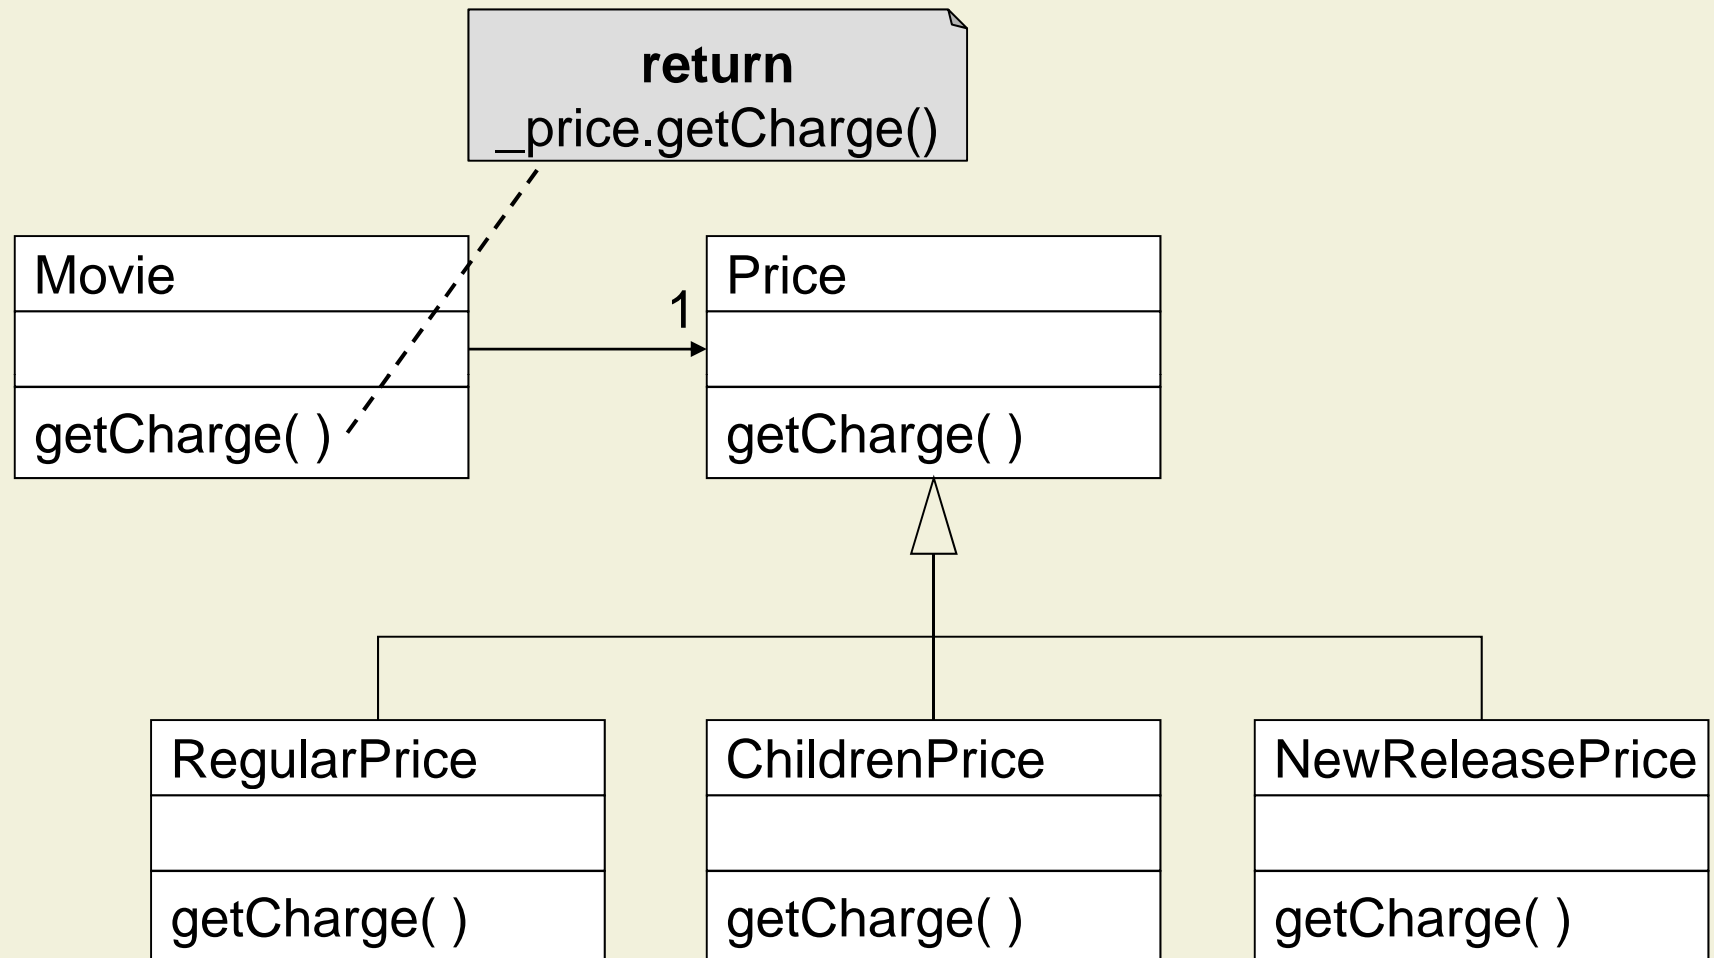

```
public class Rental {  
    public int getFrequentRenterPoints( ) {  
        return _movie.getFrequentRenterPoints( _daysRented );  
    }  
    ...  
}
```

# Subtyping

# Subtyping

## Step 13: Replace Type Code with State

```
class Movie {  
    public Movie( String name,  
                  int priceCode ) {  
        _name = name;  
        _priceCode = priceCode;  
    }  
}
```

Apply “Self-Encapsulate Field”

```
class Movie {  
    public Movie( String name,  
                  int priceCode ) {  
        _name = name;  
        setPriceCode( priceCode );  
    }  
  
    public int getPriceCode( ) {  
        return _priceCode;  
    }  
  
    public void setPriceCode( int arg ) {  
        _priceCode = arg;  
    }  
    ...  
}
```

## Step 13: Replace Type Code with State (cont'd)

Old methods persist  
because of possible  
clients

```
class Movie {  
    public int getPriceCode( ) {  
        return _price.getPriceCode( );  
    }  
}
```

Delegate call to  
new classes

```
private Price _price;  
...
```

```
public void setPriceCode( int arg ) {  
    switch ( arg ) {  
        case REGULAR:  
            _price = new RegularPrice( );  
            break;  
        case CHILDREN:  
            _price = new ChildrenPrice( );  
            break;  
        case NEW_RELEASE:  
            _price = new NewReleasePrice( );  
            break;  
        default:  
            throw new IllegalArgumentException(  
                "Incorrect Price Code" );  
    }  
}
```

Replace type  
code field by  
reference to  
new object

# Method Movie.getCharge

```
class Movie {  
    public double getCharge( int daysRented ) {  
        double result = 0;  
        switch ( getPriceCode( ) ) {  
            case REGULAR:  
                result += 2;  
                if ( daysRented > 2 ) result += ( daysRented - 2 ) * 1.5;  
                break;  
            case NEW_RELEASE:  
                result += daysRented * 3;  
                break;  
            case CHILDREN:  
                result += 1.5;  
                if ( daysRented > 3 ) result += ( daysRented - 3 ) * 1.5;  
                break;  
        } /* switch */  
        return result;  
    }  
    ...  
}
```

switch should  
work on Price

## Step 14: Move Method

```
class Price {  
    public double getCharge( int daysRented ) {  
        double result = 0;  
        switch ( getPriceCode( ) ) {  
            case Movie.REGULAR:  
                result += 2;  
                if ( daysRented > 2 ) result += ( daysRented - 2 ) * 1.5;  
                break;  
            case Movie.NEW_RELEASE:  
                result += daysRented * 3;  
                break;  
            case Movie.CHILDREN:  
                result += 1.5;  
                if ( daysRented > 3 ) result += ( daysRented - 3 ) * 1.5;  
                break;  
        } /* switch */  
        return result;  
    }  
    ...  
}
```

## Step 14: Move Method (cont'd)

```
class Movie {  
    public double getCharge( int daysRented ) {  
        return _price.getCharge( daysRented );  
    }  
    ...  
}
```

## Step 15: Replace Conditional with Polymorph.

```
class RegularPrice {  
    public double getCharge( int daysRented ) {  
        double result = 2;  
        if ( daysRented > 2 ) result += ( daysRented - 2 ) * 1.5;  
        return result;  
    }  
    ...  
}
```

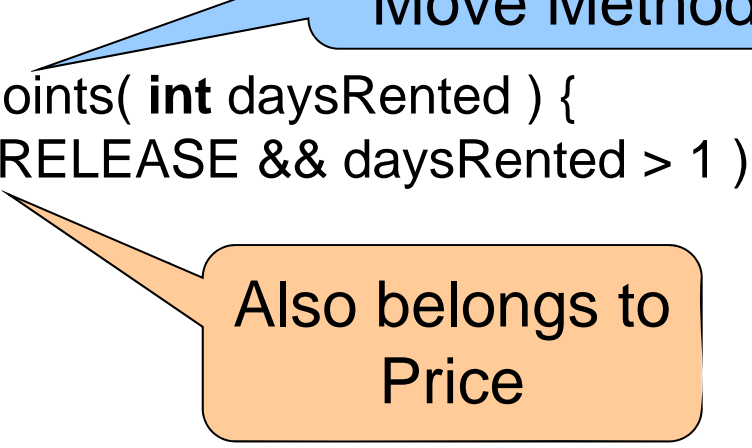

Put each case of the switch into an overriding method

```
class NewReleasePrice {  
    public double getCharge( int daysRented ) {  
        return daysRented * 3;  
    }  
    ...  
}
```

```
class ChildrenPrice {  
    ...  
}
```

# Method `Movie.getFrequentRenterPoints`

```
public class Movie {  
    public int getFrequentRenterPoints( int daysRented ) {  
        if ( getPriceCode( ) == NEW_RELEASE && daysRented > 1 )  
            return 2;  
        else  
            return 1;  
    }  
    ...  
}
```

```
public class Movie {  
    public int getFrequentRenterPoints( int daysRented ) {  
        return _price. getFrequentRenterPoints( daysRented );  
    }  
    ... }  
}
```

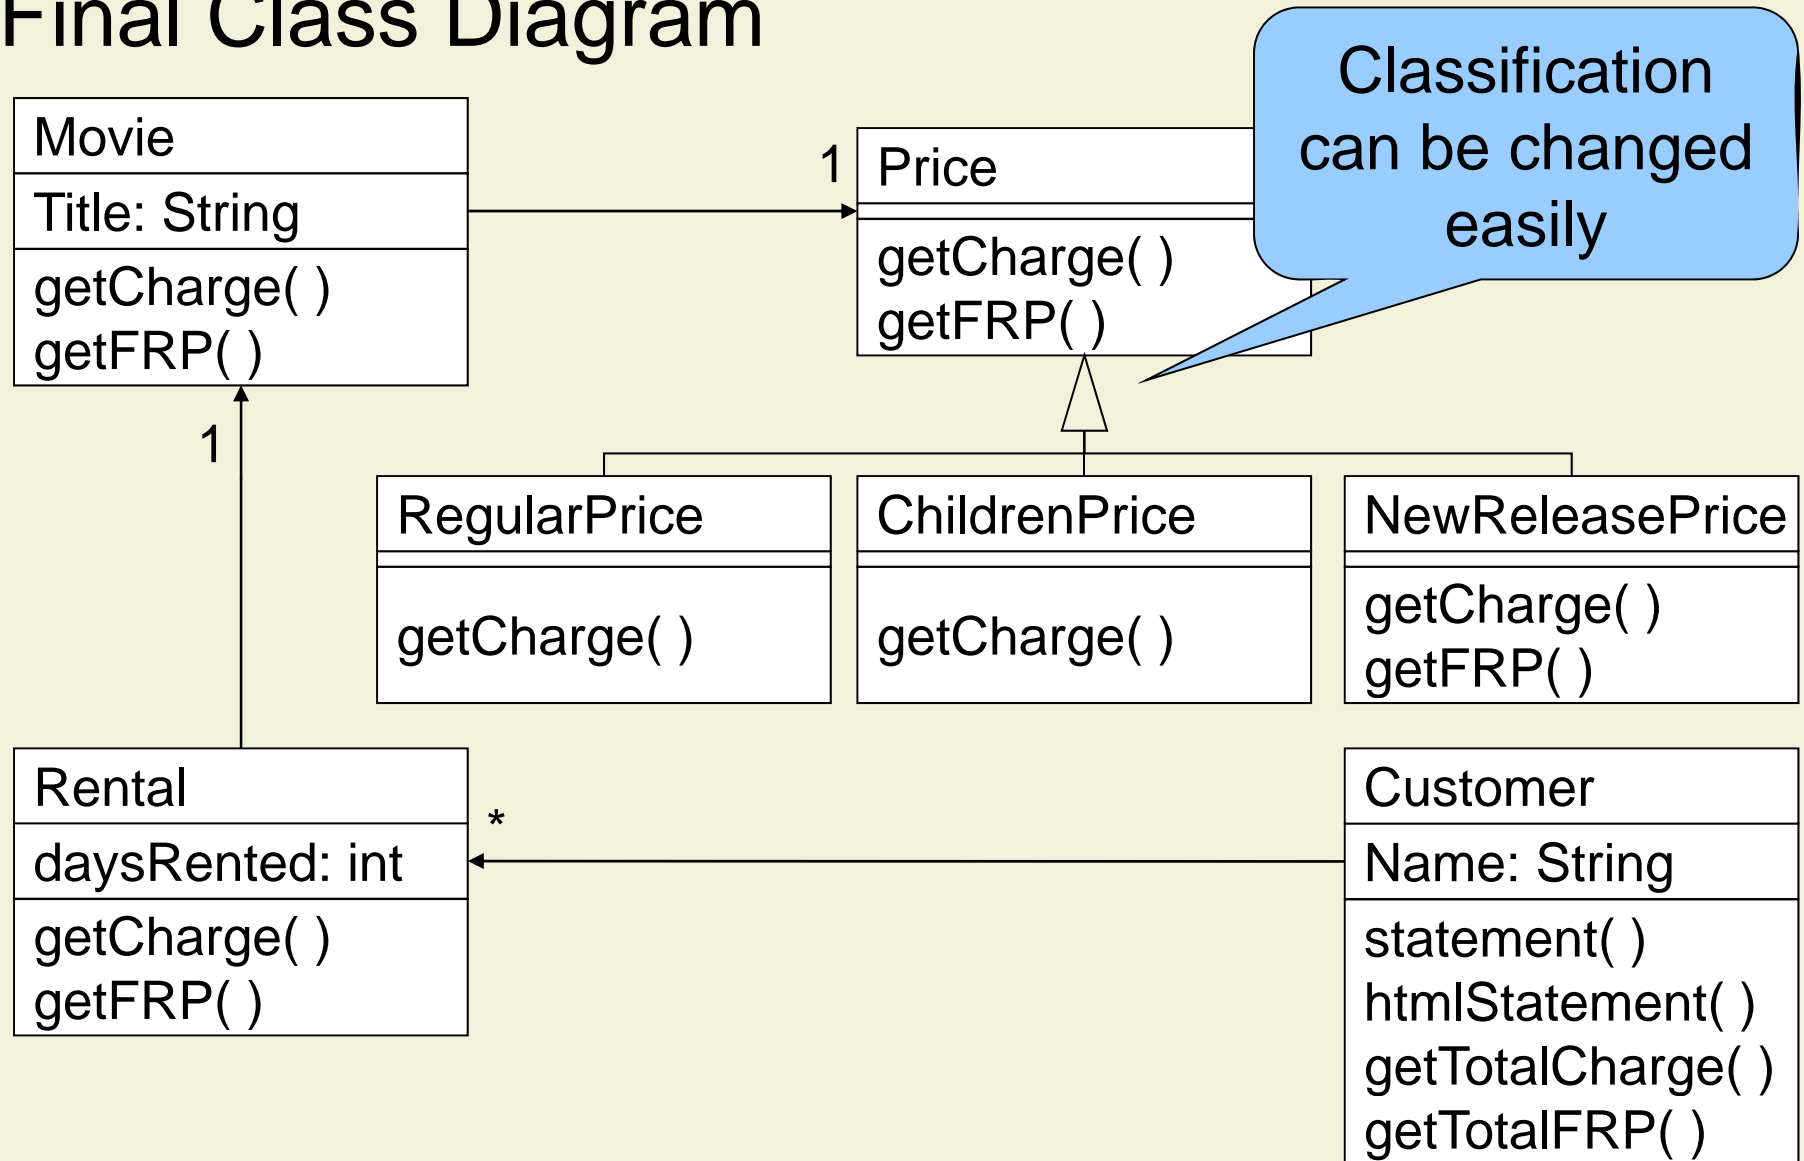

## Step 16: Replace Conditional with Polymorph.

```
class Price {  
    public int getFrequentRenterPoints( int daysRented ) {  
        return 1;  
    }  
    ... }
```

RegularPrice and  
ChildrenPrice use  
inherited method

```
class NewReleasePrice {  
    public int getFrequentRenterPoints( int daysRented ) {  
        return daysRented > 1 ? 2 : 1;  
    }  
    ... }
```

# Final Class Diagram

# 6. Implementation

## 6.1 Mapping Models to Code

## 6.2 Code Optimization

## 6.3 Refactoring

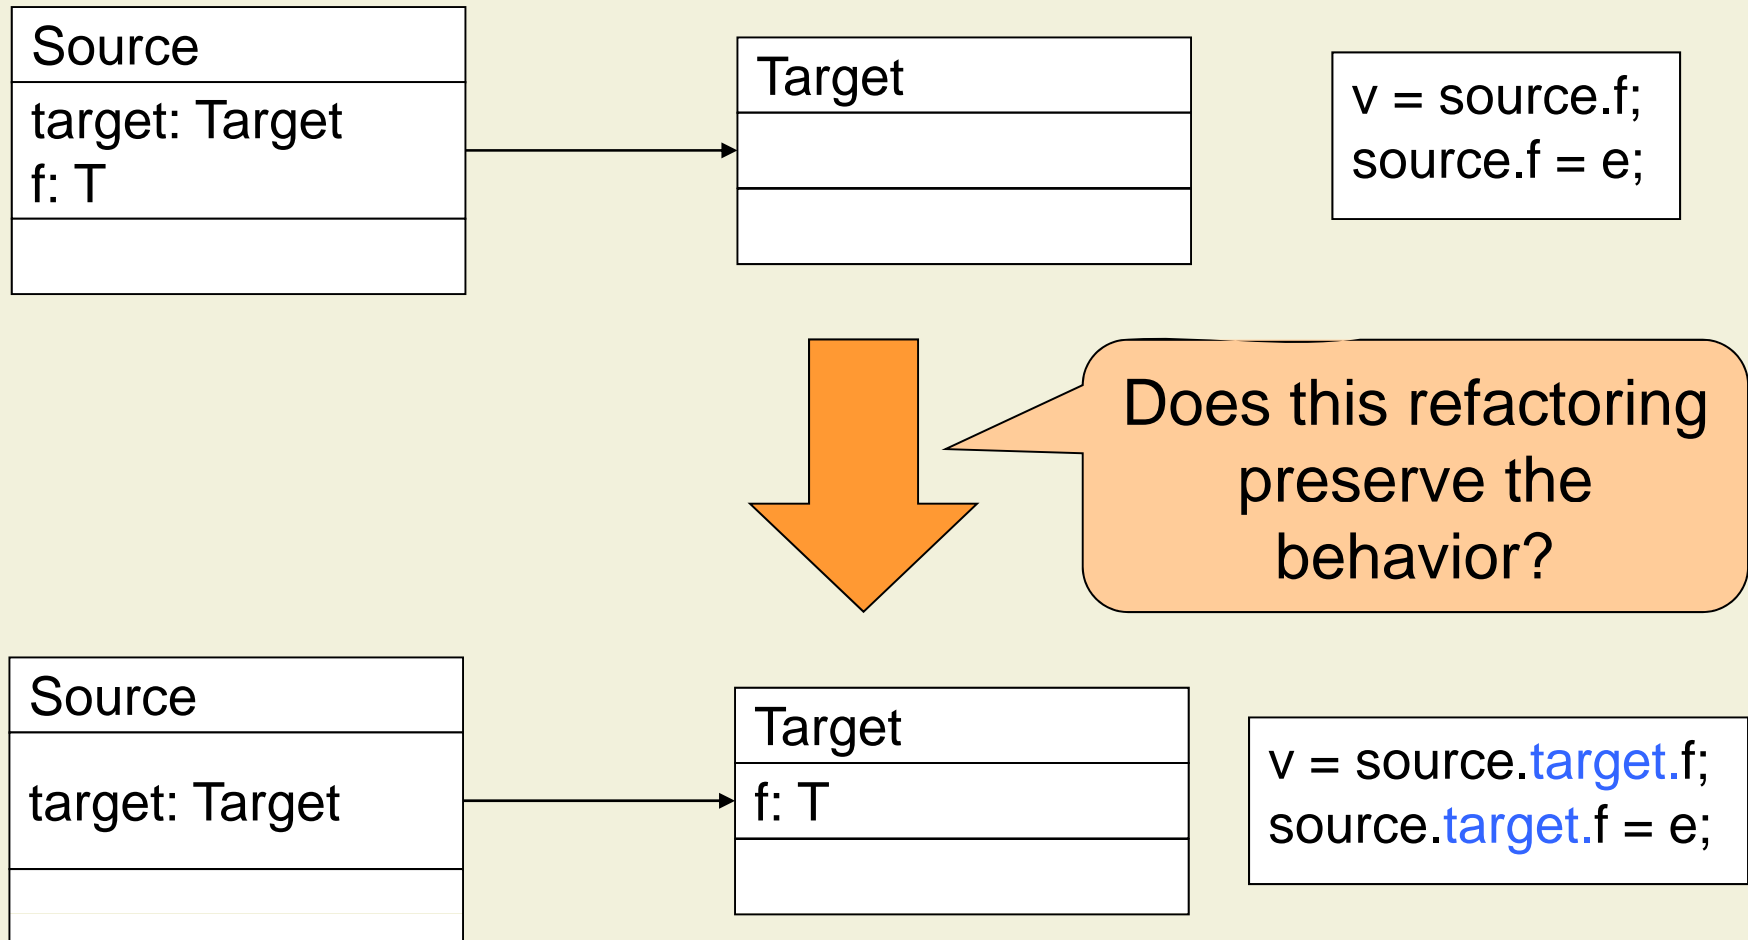

### 6.3.1 Example

### 6.3.2 Discussion

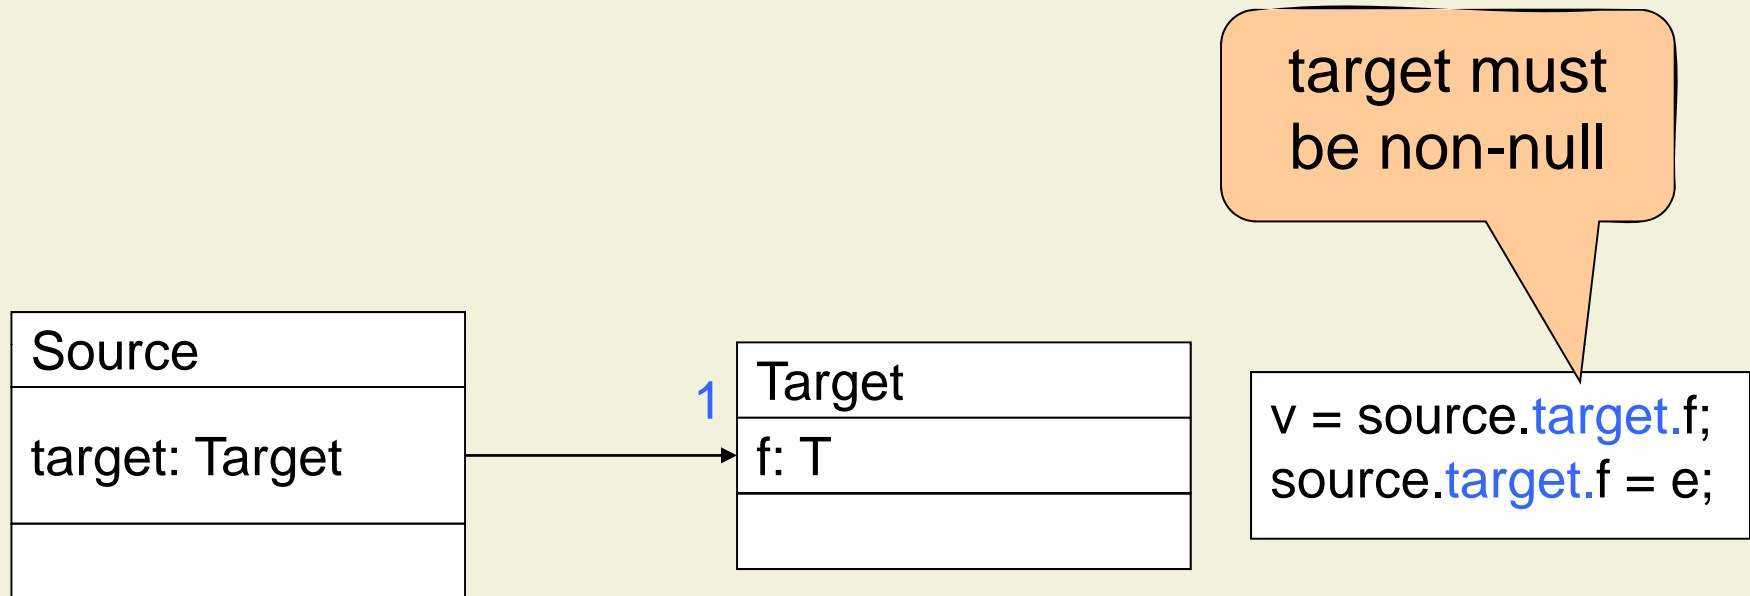

## Tool Support

- Refactorings can be applied to models and to code
- IDE provide support for code refactorings
- However, the support is very limited
  - Only simple refactorings
  - Preservation of behavior is not guaranteed
  - Sometimes, not even syntactic correctness is guaranteed

# Complex Refactoring: Move Field

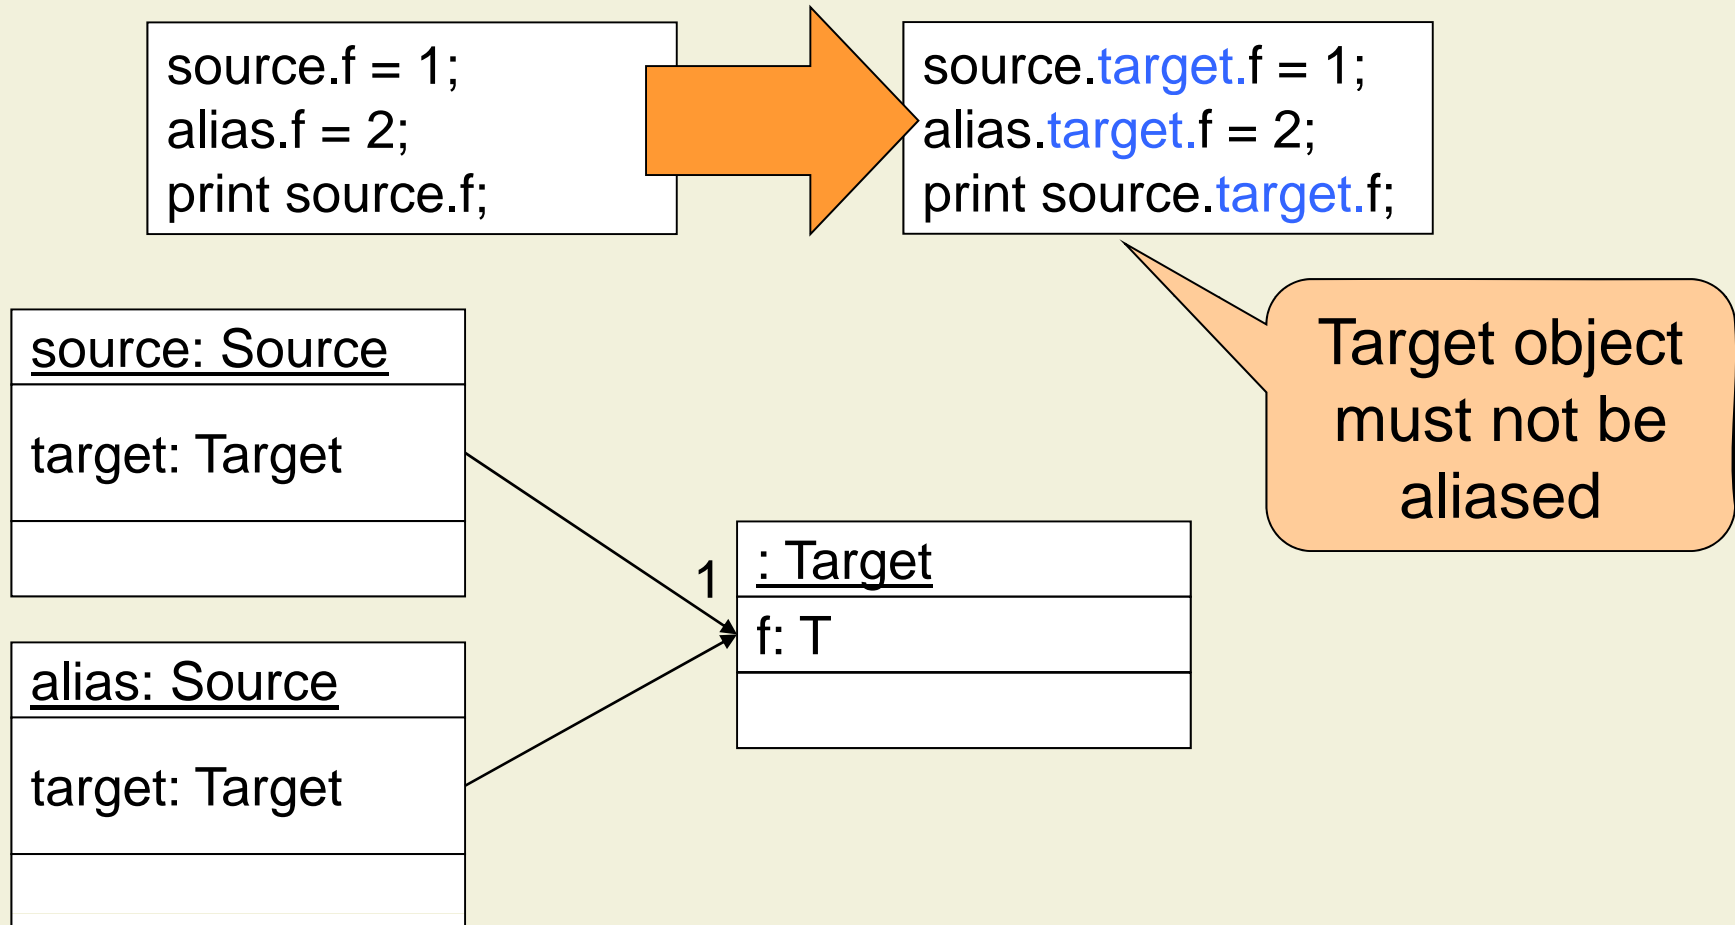

# Correctness Conditions for Move Field

- Treatment of constructors is difficult
  - target must be initialized before f?

# Correctness Conditions for Move Field (cont'd)

# Correctness Conditions for Move Field (cont'd)

- Move field requires a one-to-one association
  - Difficult to check for code refactorings

# Refactoring Principles

- Why do we refactor?
  - To **improve the design** of software
  - To make software **easier to understand**
- When should we refactor?
  - Refactor when you **add functionality**
  - Refactor when you need to **fix a bug**
  - Refactor as you do **code reviews**
  - Refactor when the code **starts to smell**
- What about performance?
  - Worry about performance **only when you have identified a performance problem**
