E-Bike City network **Design**

Designing the Bike Network Using Mathematical Optimization

Problem: Scenario exploration for bike network design and evaluation relies on heuristic methods and manually crafted evaluations.

Combinatorial Problem: involves multiple objectives.

Optimization Approach: linear programming formulation.

Pareto Frontier: illustrates multiple optimal scenarios.

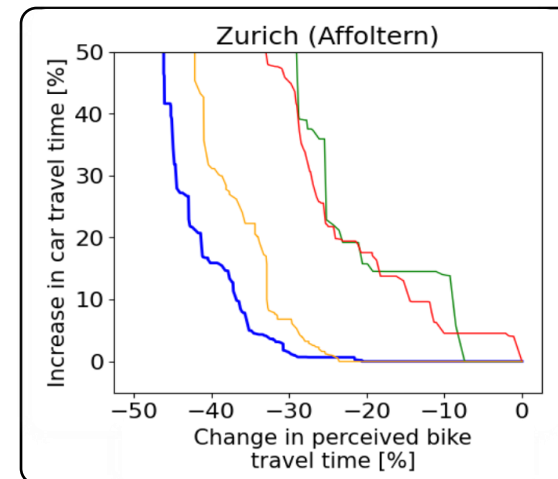

Performance: outperforms heuristic approaches.

Flexibility: adaptable to various evaluation criteria.

Optimization

Assessment

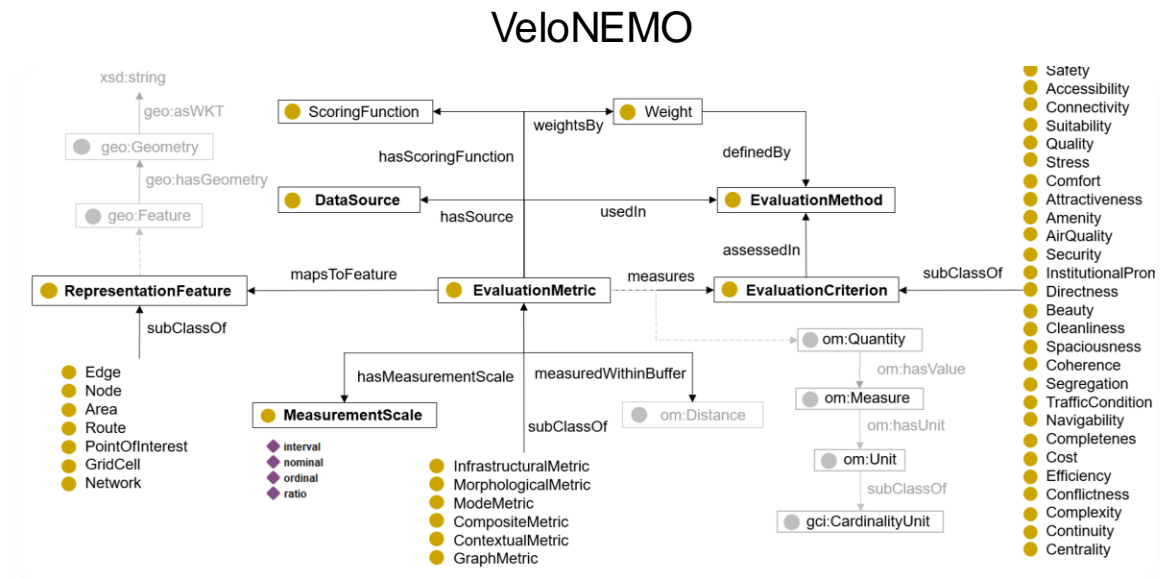

— Optimization — Betweenness bottom-up (bike) — Betweenness top-down — Betweenness bottom-up (car)

E-Bike City network **Evaluation**

Bike Network Evaluation Metrics Ontology (VeloNEMO)

- **Interpretability Problem:** metric representations are ambiguous.
- **Formal Ontology:** a structured approach to interpret evaluation metrics.
- **Knowledge Graph:** the first database for common evaluation metrics.
- **Meta-analysis:** automated evaluation comparison.
- **Scenario Exploration:** multi-criteria evaluation frameworks.

Take away: we propose methods to streamline scenario explorations and support bike network design and evaluation.
