Powering a sustainable-circular economy

Energy we all need ... but how much renewable energy
are we allowed to use within Earth system limits?

Frontiers in Energy Research, 18.02.2020, ETH Zürich

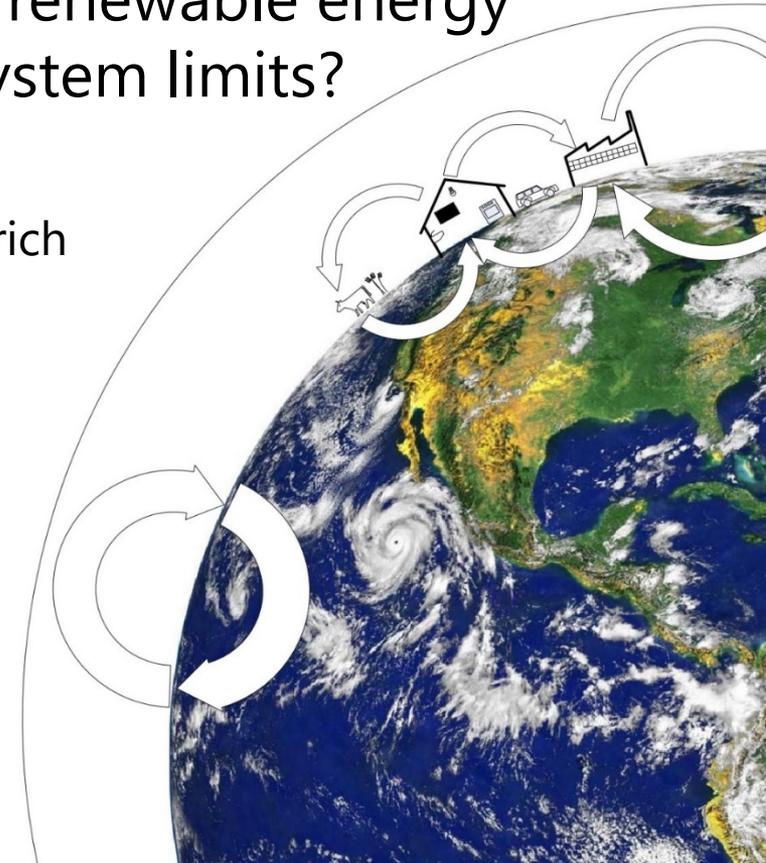

Harald Desing

Technology & Society Laboratory (TSL), Empa, Lerchenfeldstrasse 5,
9014 St. Gallen, Switzerland

Harald.desing@empa.ch

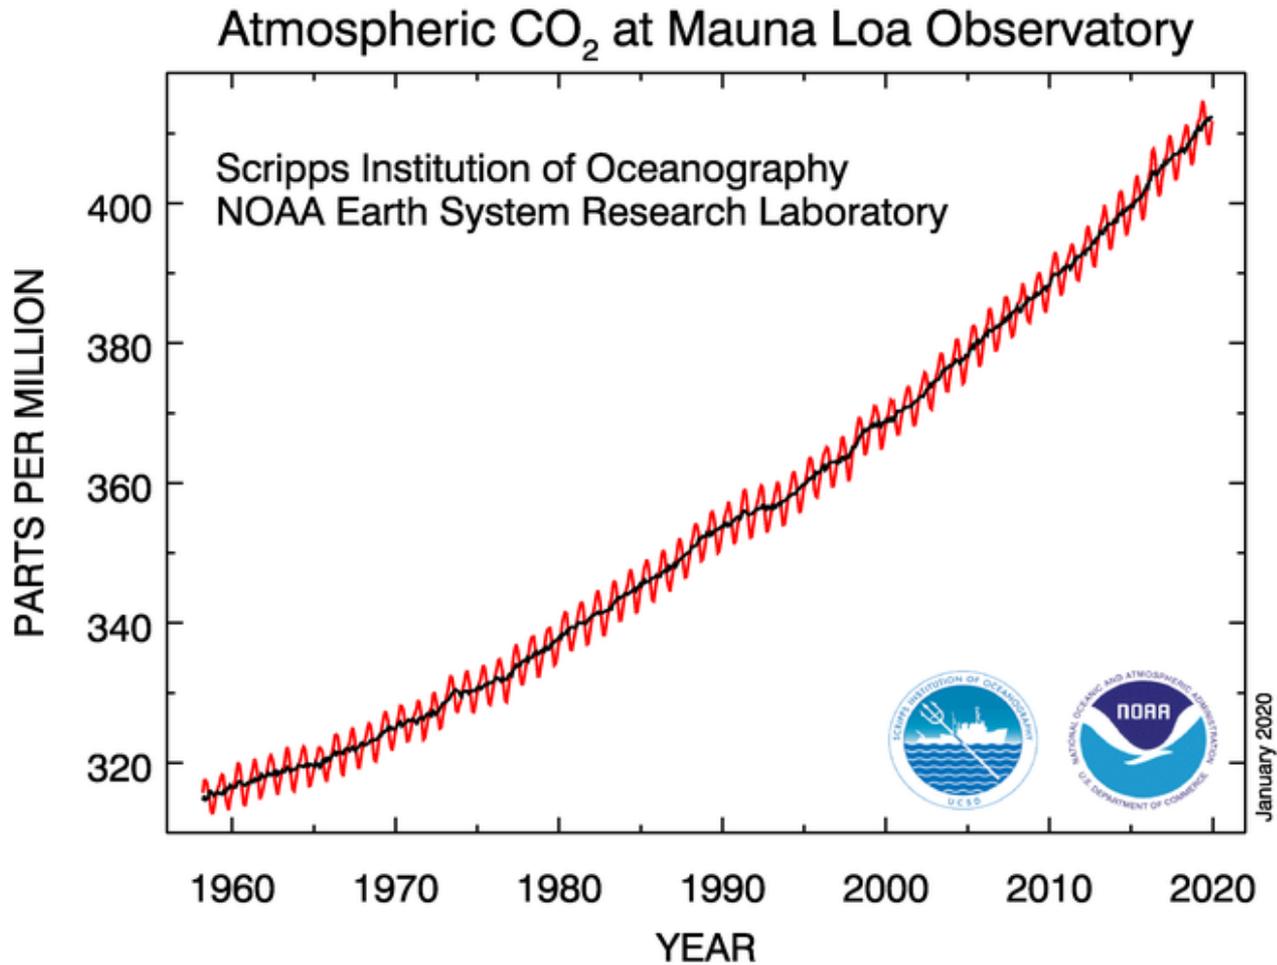

Project:

Laboratory for Applied Circular Economy (LACE)

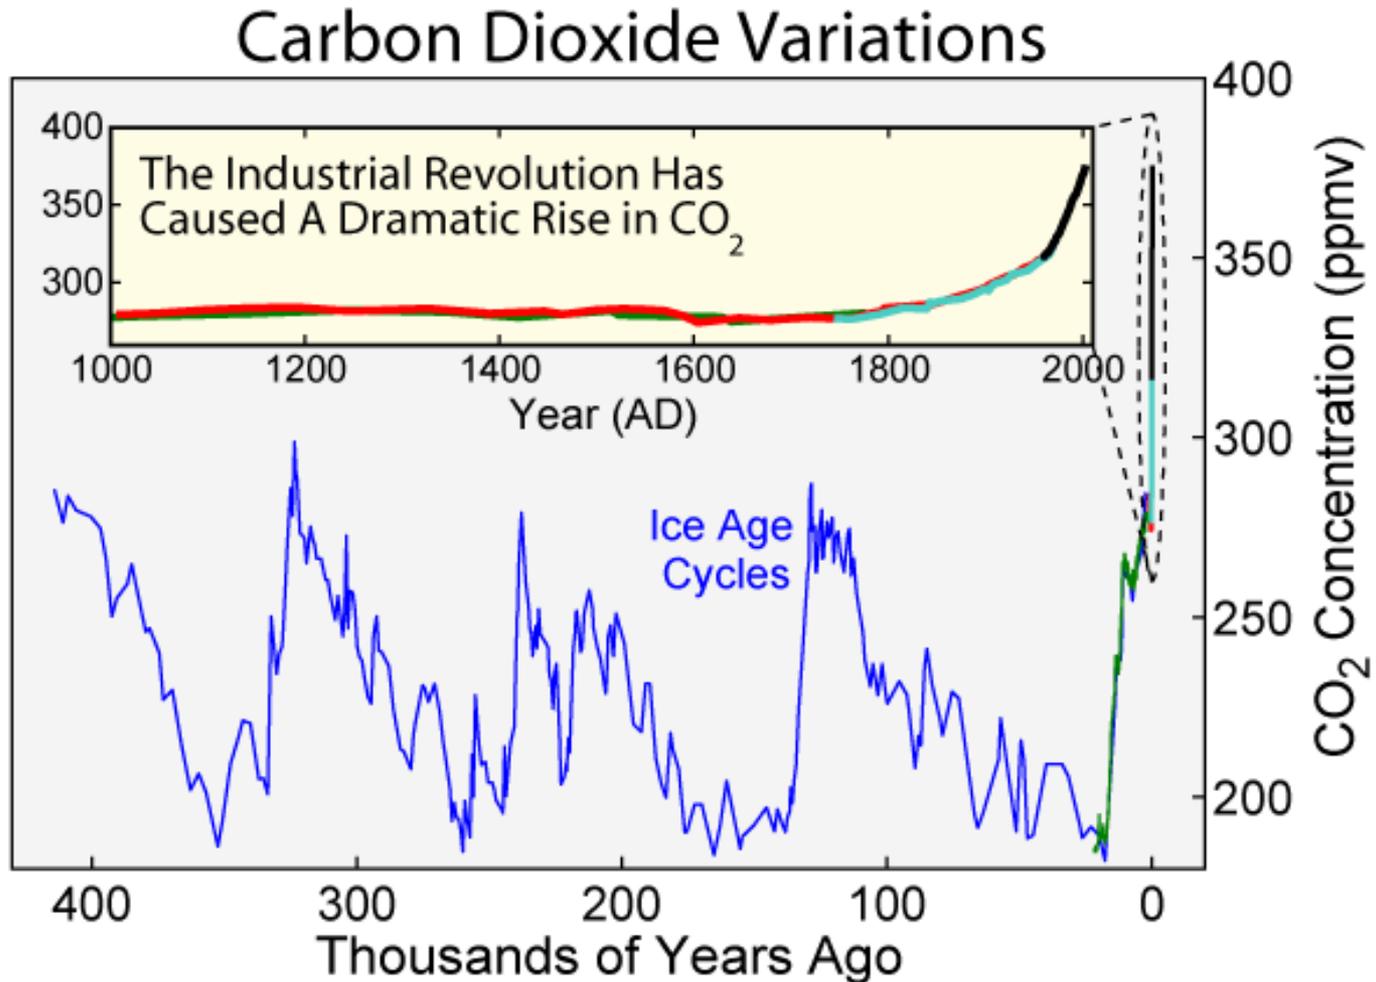

Stone age didn't end because we
ran out of stones...

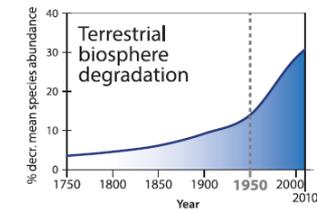

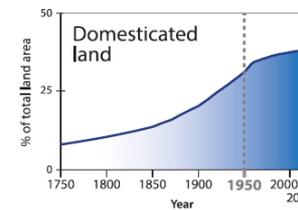

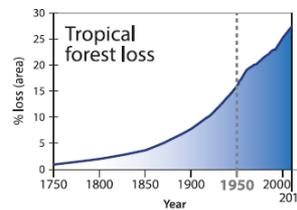

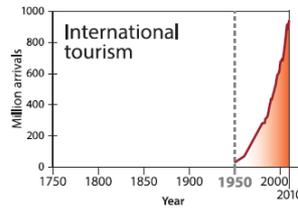

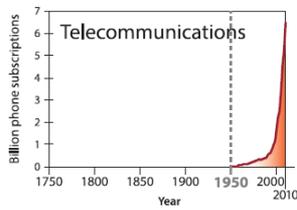

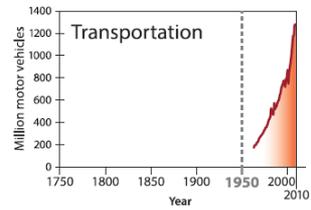

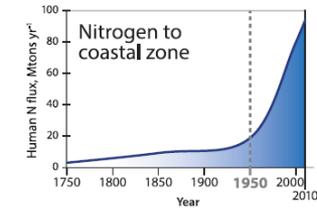

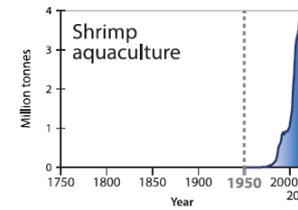

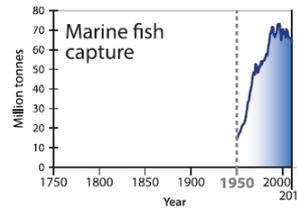

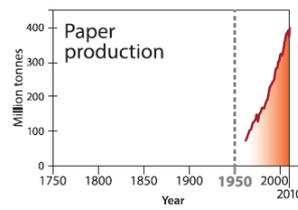

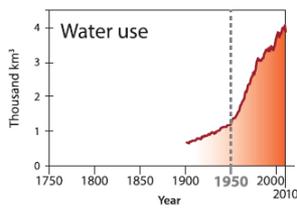

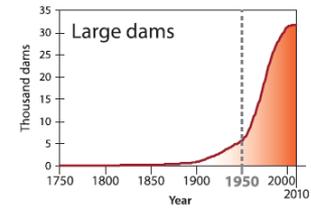

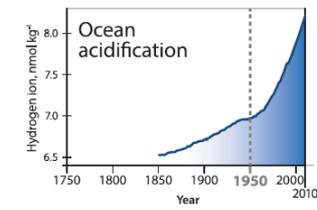

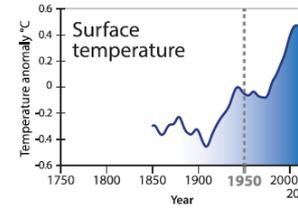

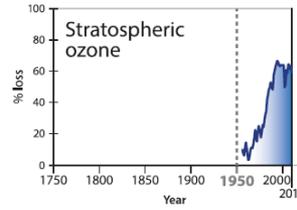

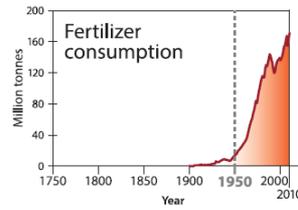

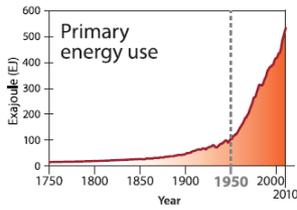

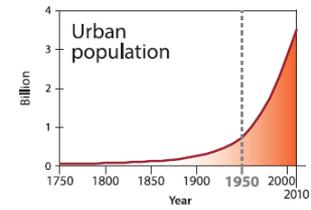

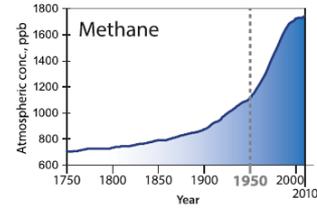

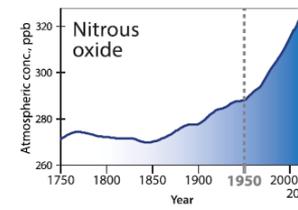

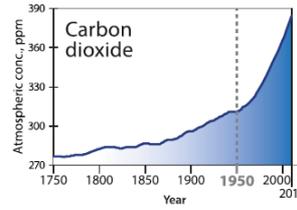

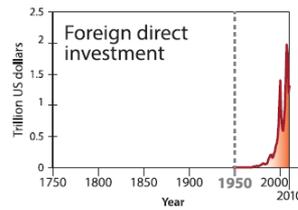

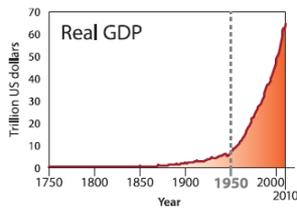

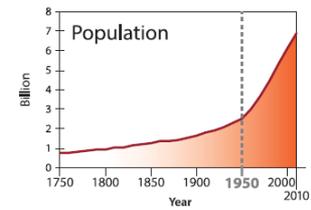

CO₂ concentration in the atmosphere

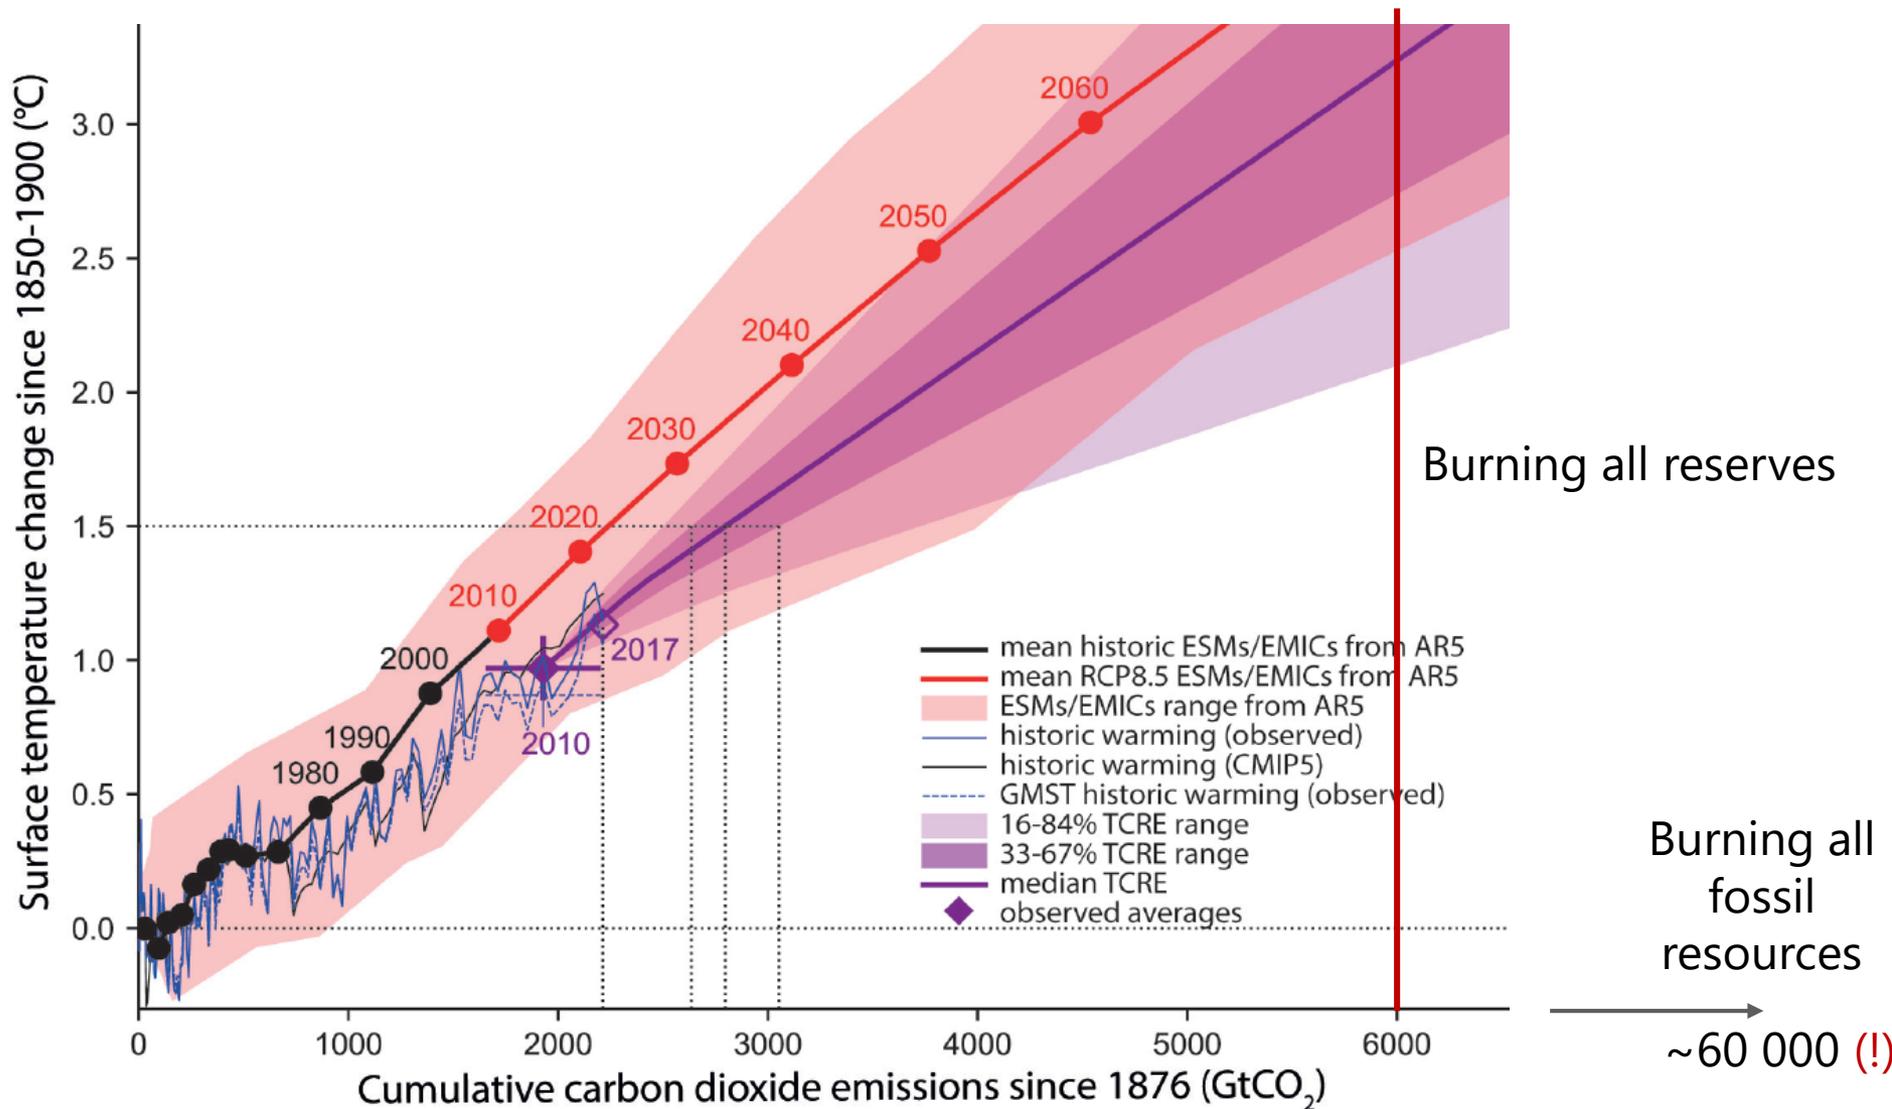

Atmospheric CO₂ concentration over time

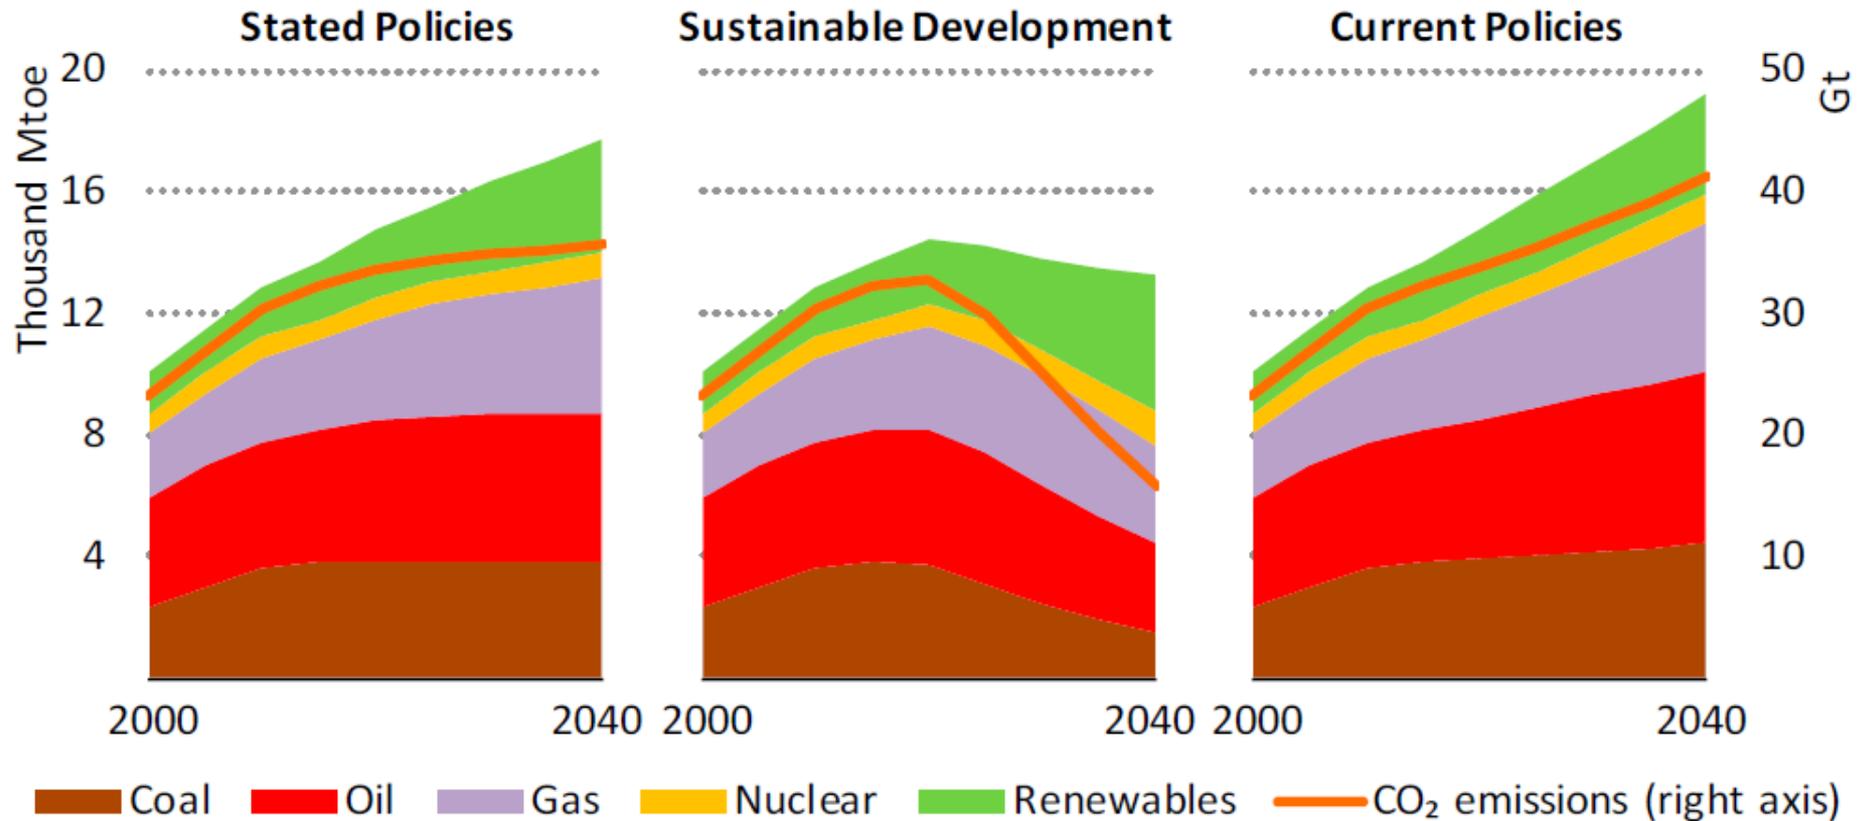

The Great Acceleration

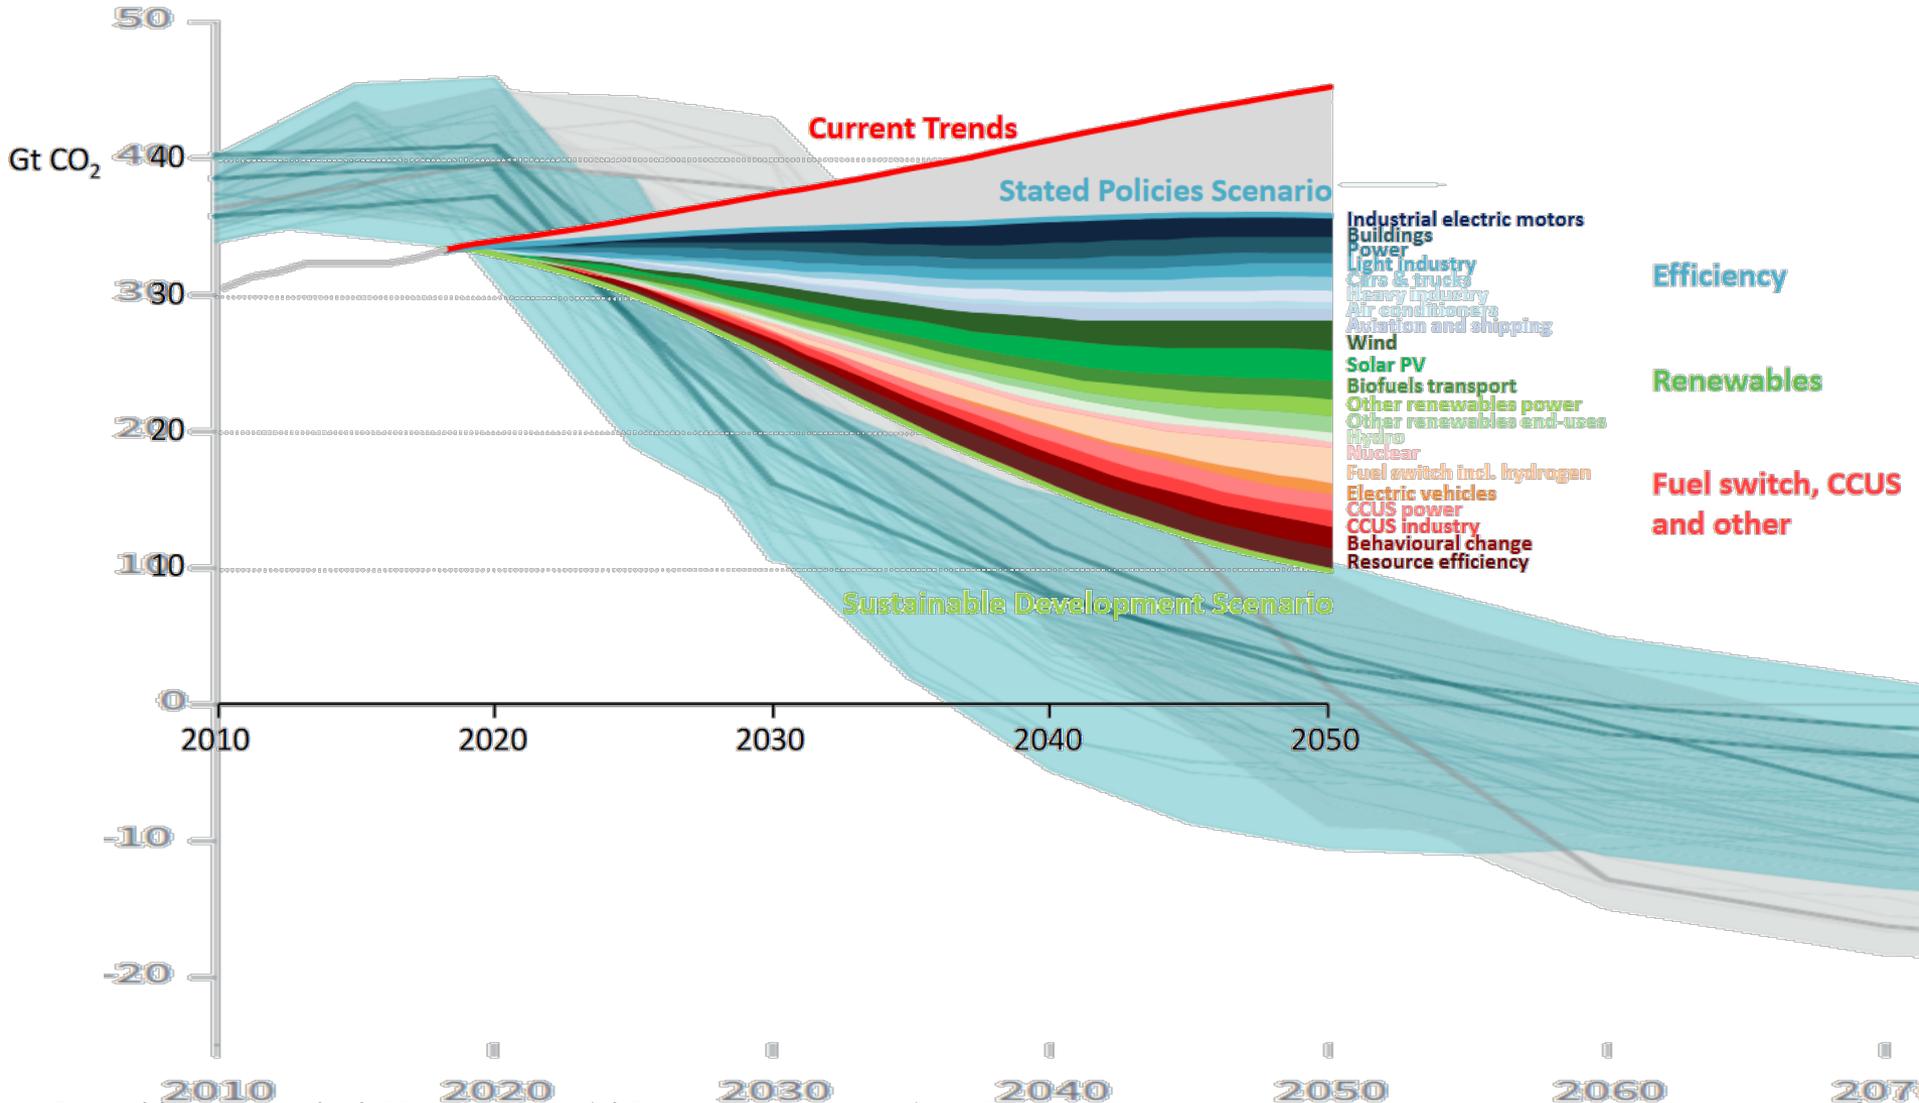

CO₂ emissions vs. temperature change

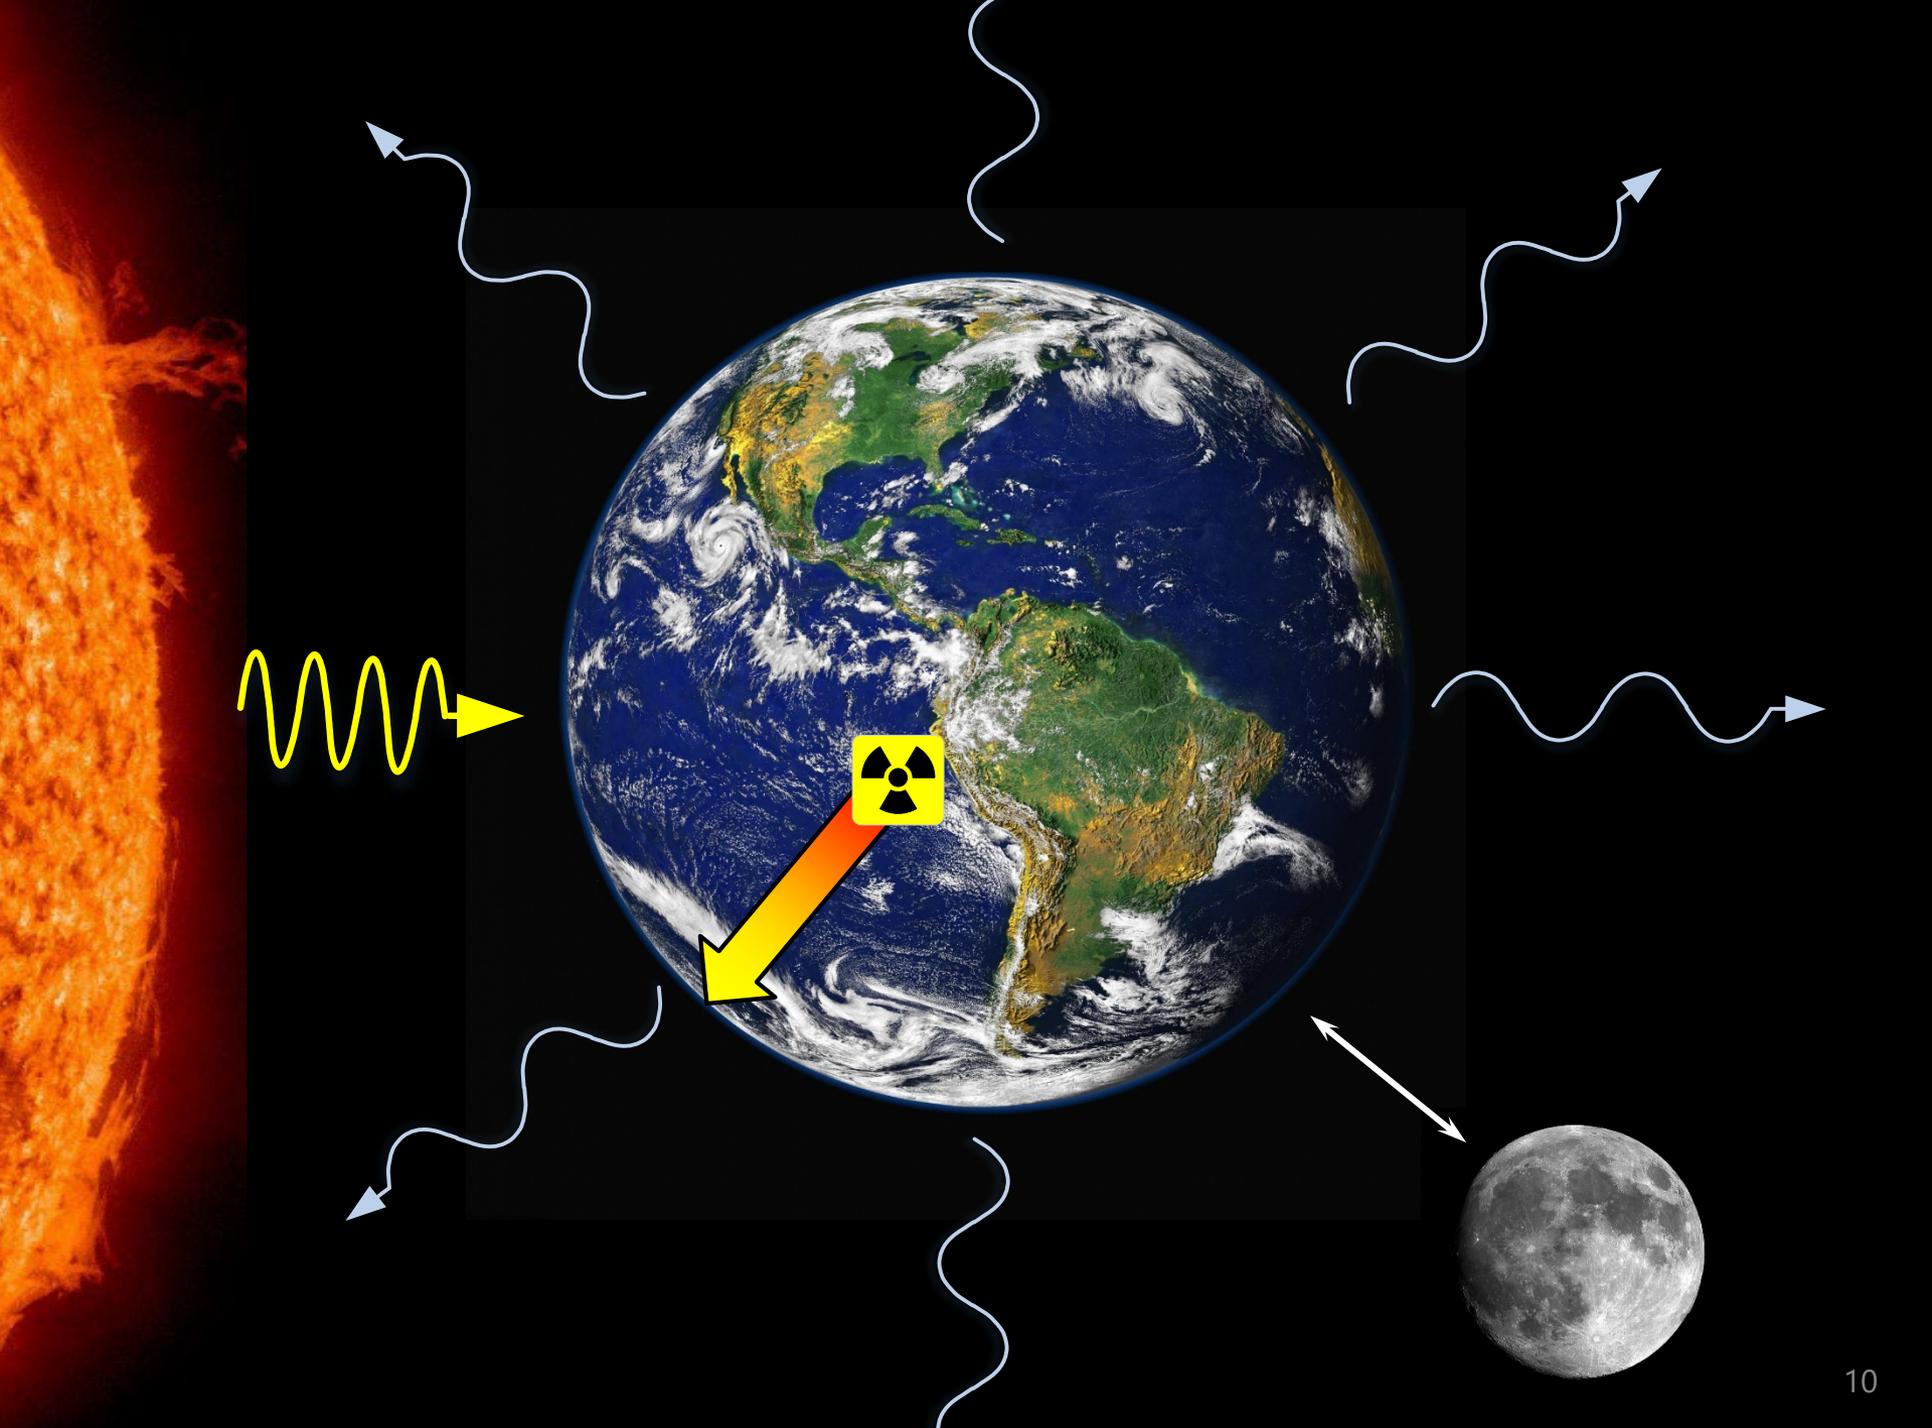

IEA's prediction of future energy system

CO₂ emission development in IEA scenarios

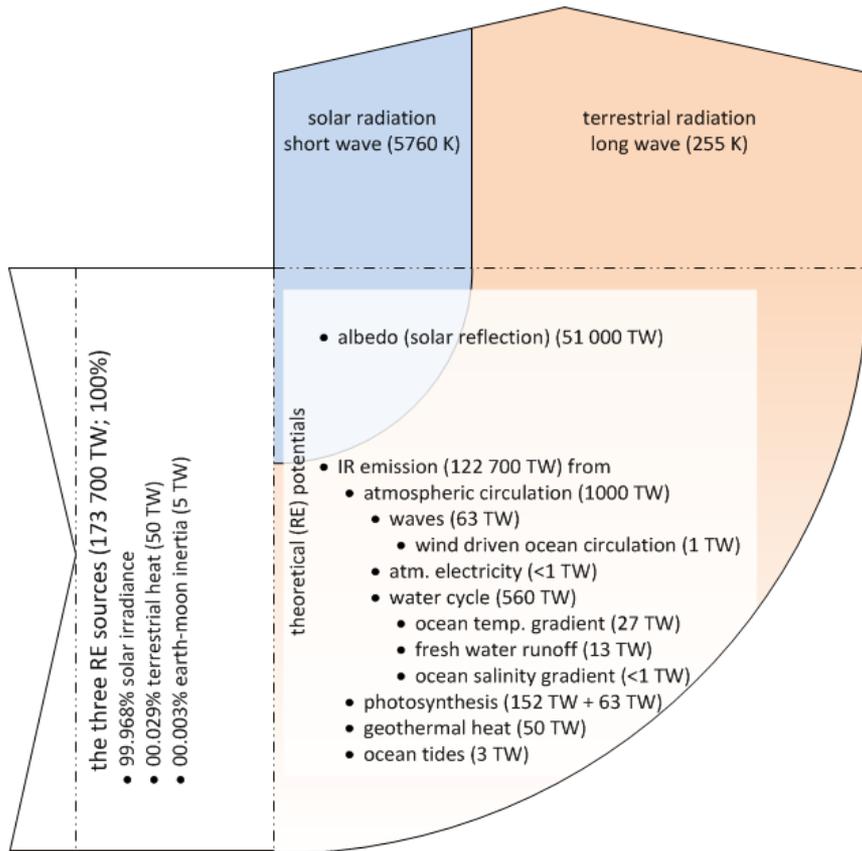

RE potentials

ThP > TP > ATP > EP

Theoretical potential

Technical potential

Economic potential

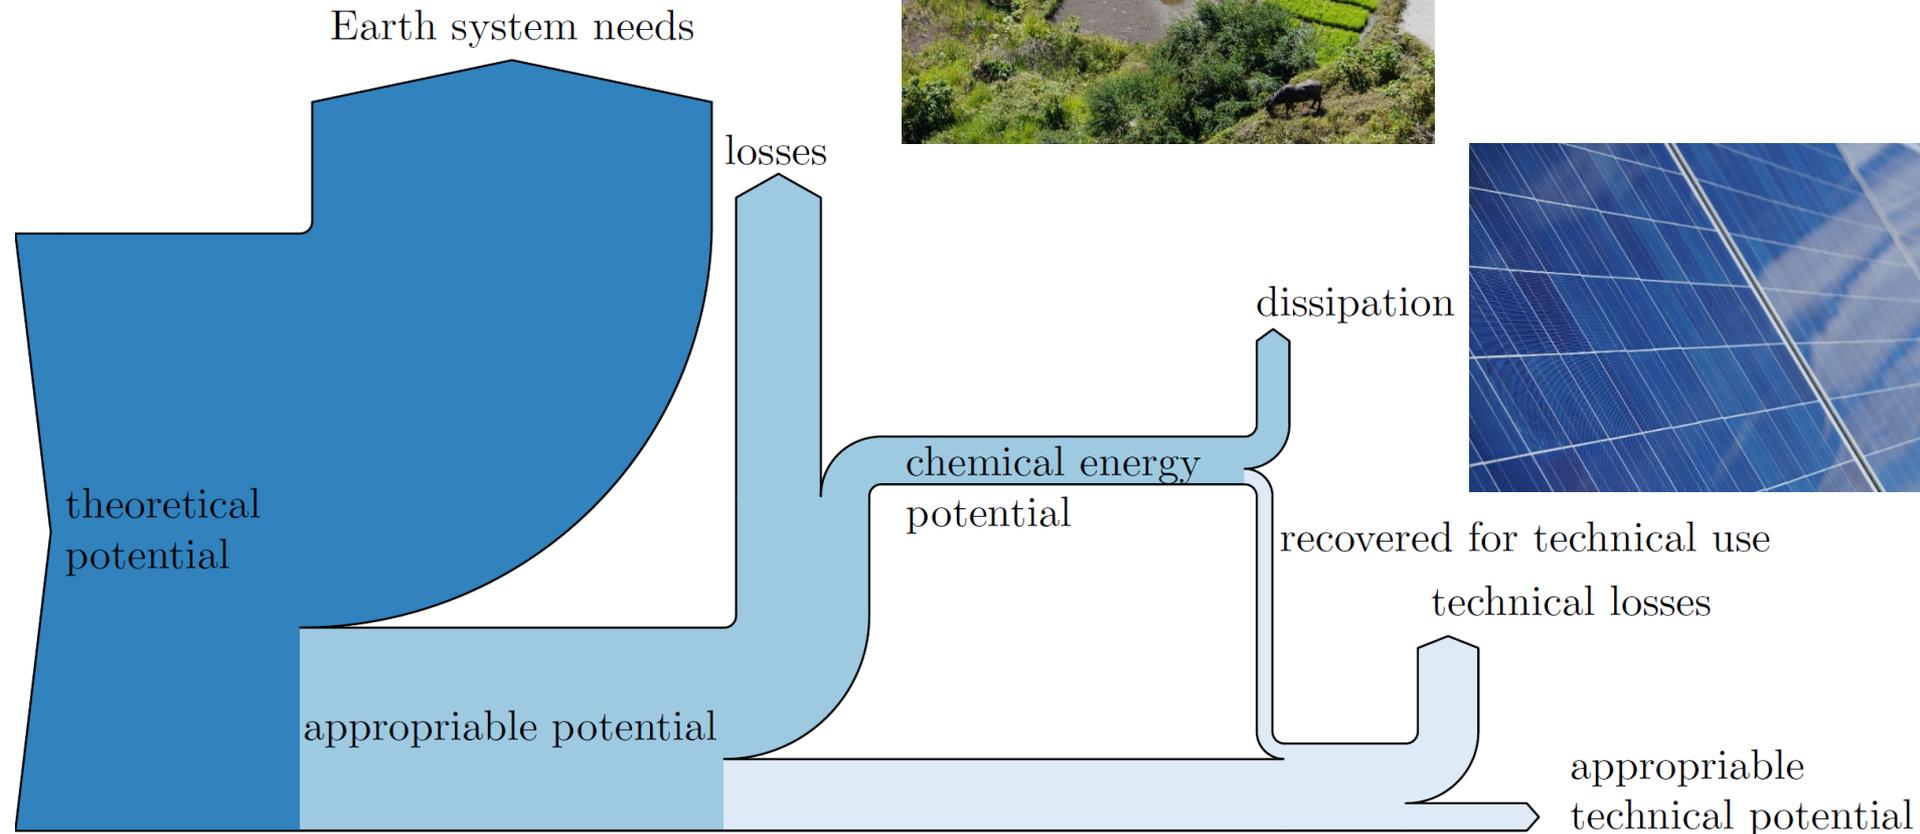

Potential: no impacts from production and EoL treatment of harvesting technology considered

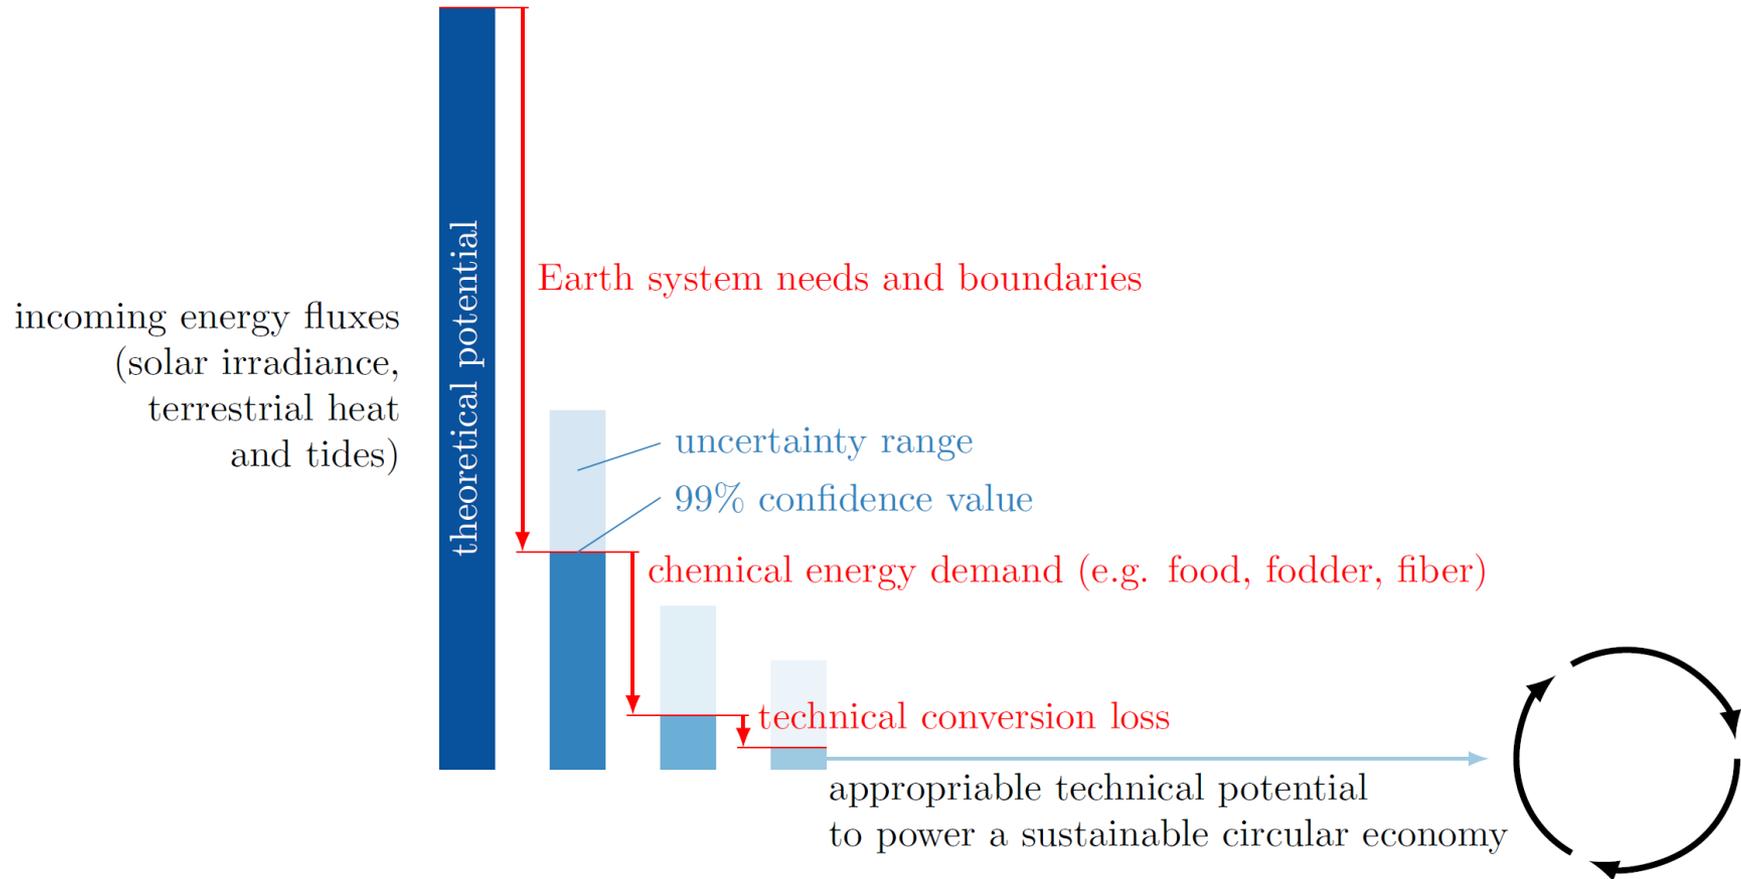

Technical: converted to electricity with state-of-the-art technology

Appropriable: can be safely diverted from the Earth system

Limits to renewable energy conversion

ATP method overview

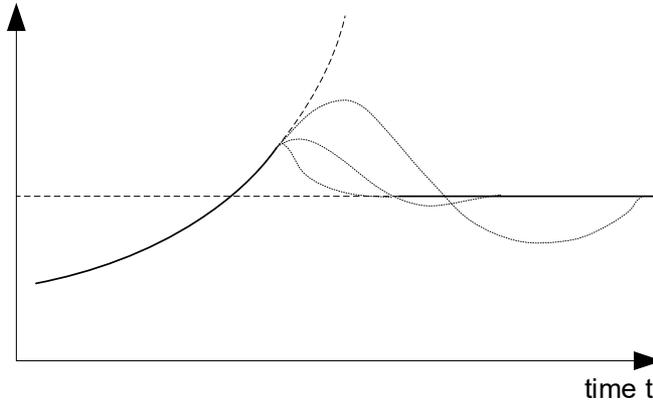

Quantities and units of comparison

- Energy is conserved (1st law of thermodynamics)
- Exergy content different (2nd law)
- Proposal (instead of Mtoe):
 - Electric energy equivalent as universal currency
- 100 % Exergy
- Can be converted to any other energy form
- Output of most RE systems (except low temperature heat from geothermal and solar thermal systems)
- Low temperature heat can be (in principle) provided using a heat pump (COP = [3,4])
- Input for e-mobility (trains, trolleybuses, battery vehicles) and synthetic fuels (e.g., H₂, P2G)

System model

0-dimensional model

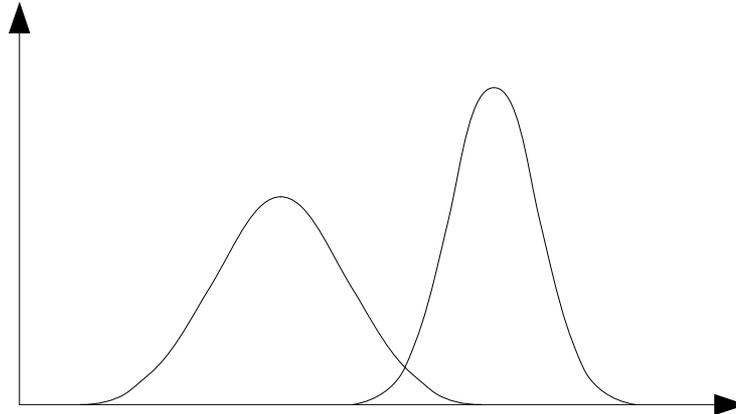

steady-state

state-of-the-art technology

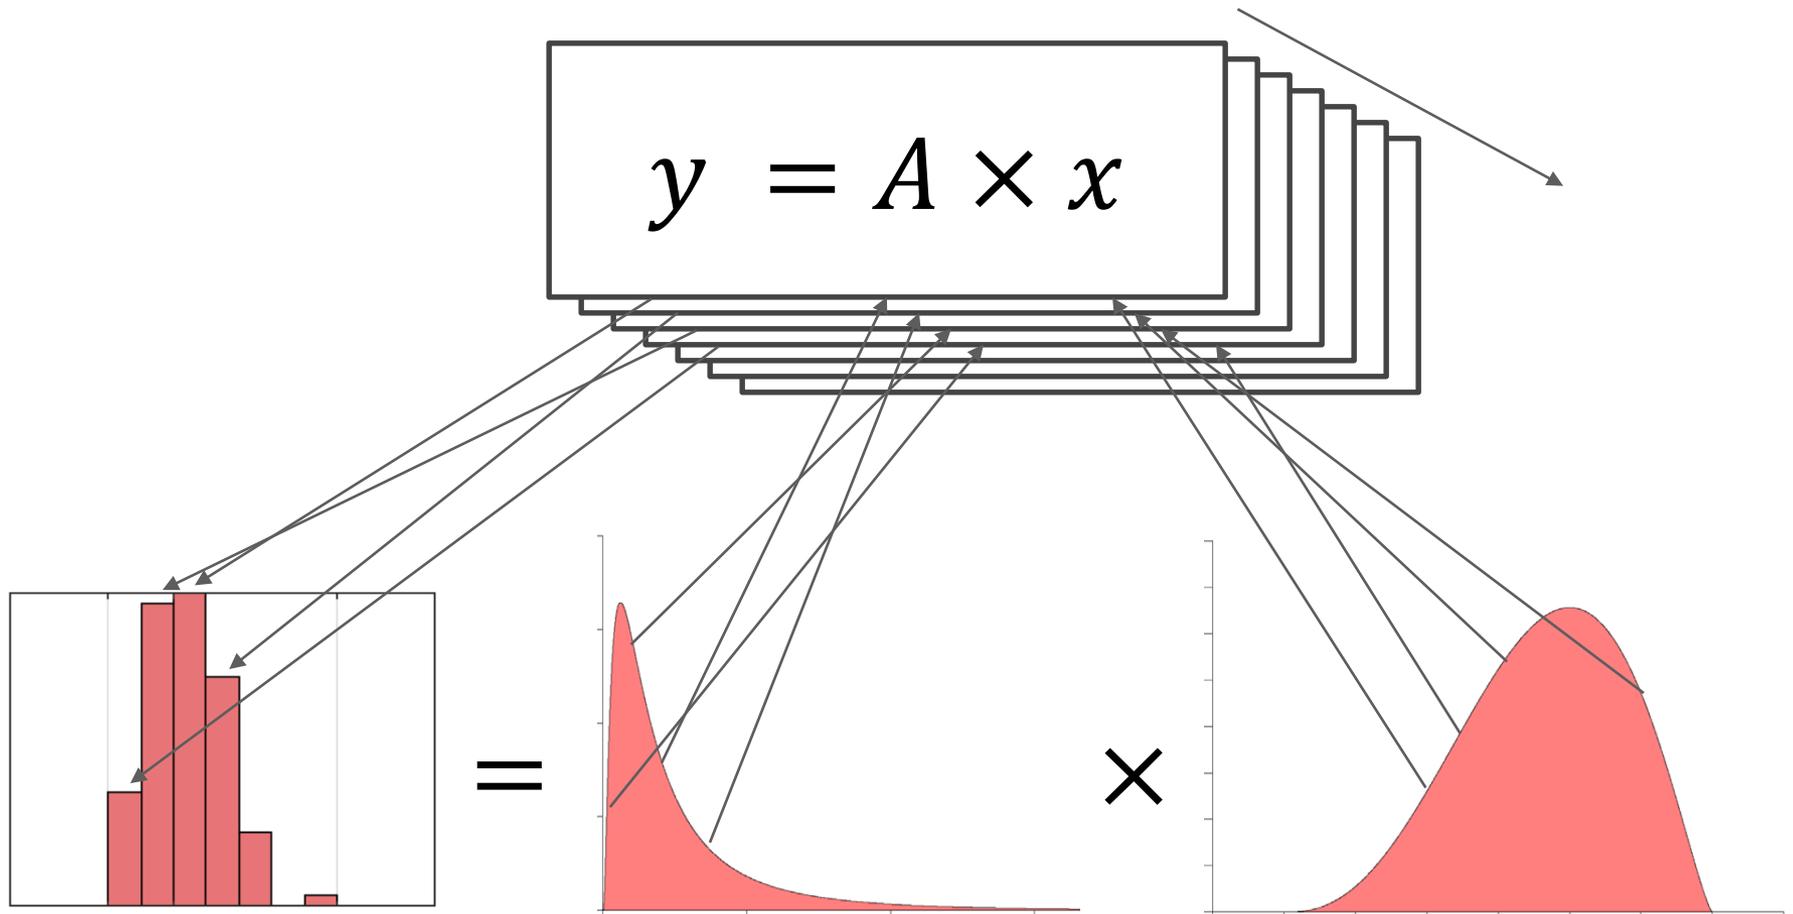

Precautionary approach

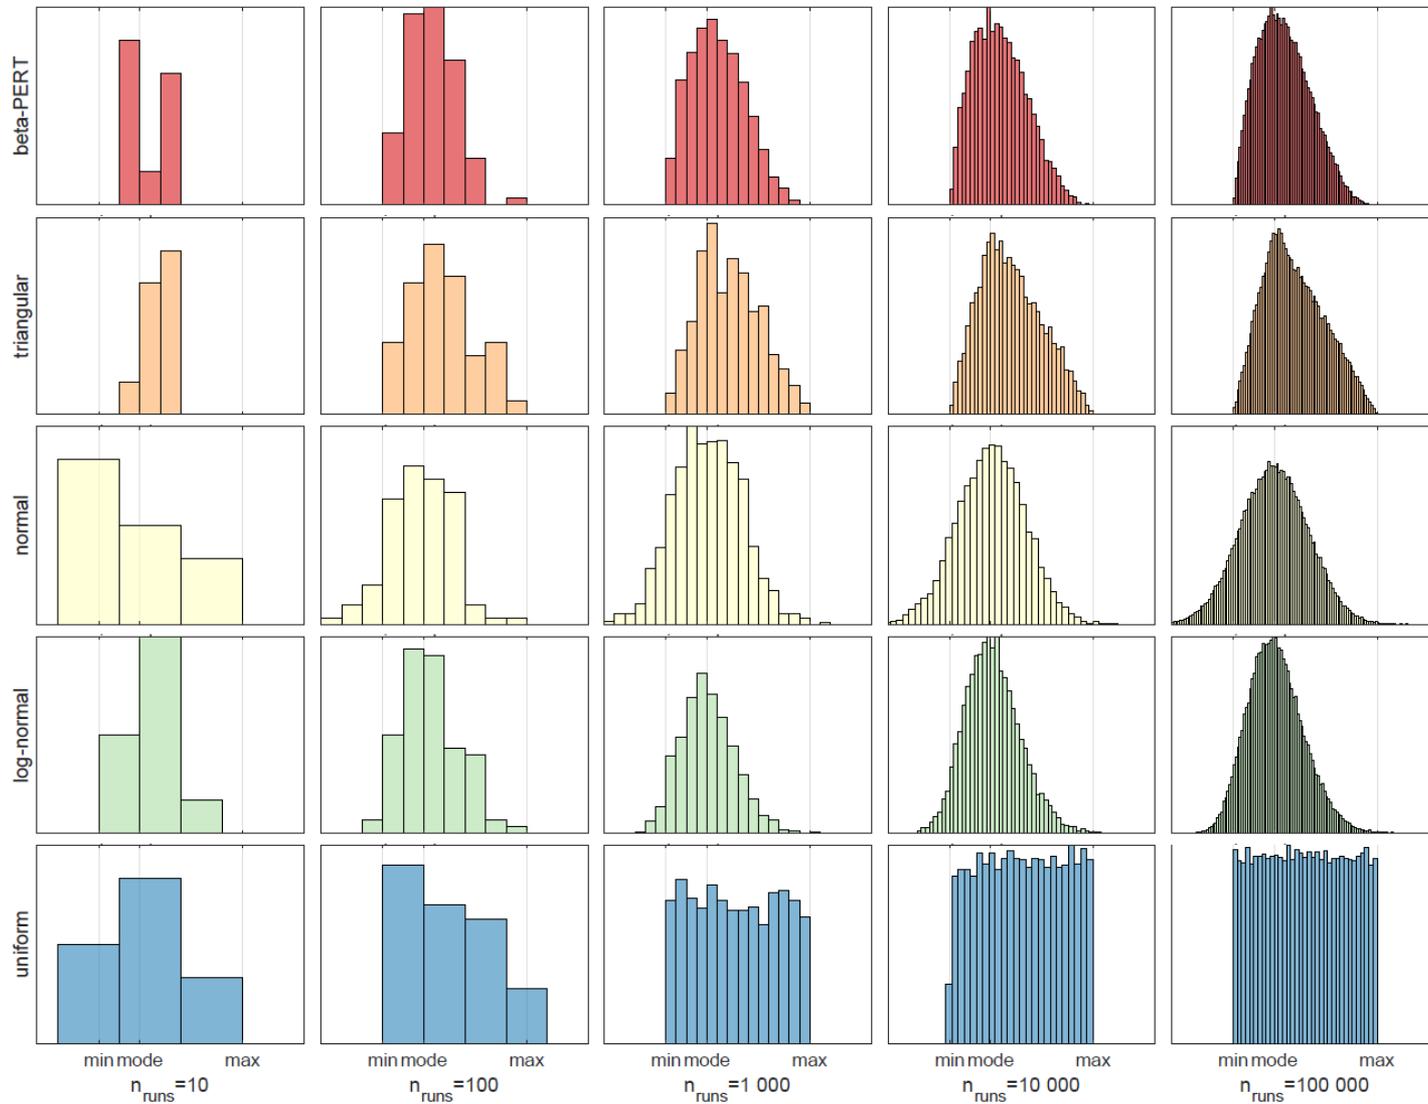

What is an acceptable confidence in a system?

- Engineering
 - Designed probability of survival
 - Critical systems (e.g., aircrafts) >99.9%
 - Nuclear powerplant >99.999%
 - Has to be proven experimentally or arithmetically
- Climate target compatible socio-economic pathways
 - To reach 2°C target: 66% (IPCC 2015)
 - To reach 1.5°C target: 50% (IPCC 2018)
- Ethical and social question: How much confidence to we require for building a viable socio-economic system?
- Input parameter to ATP method

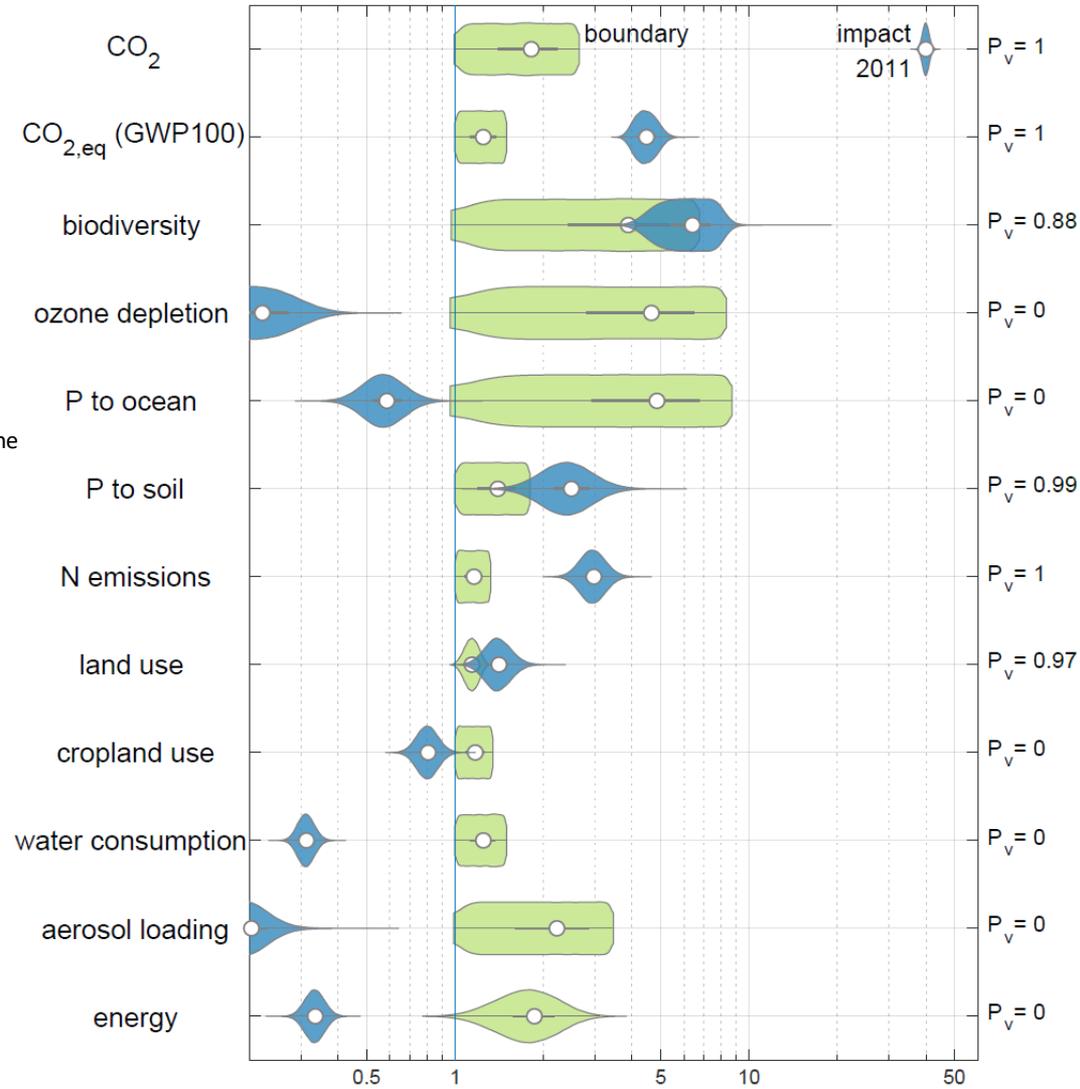

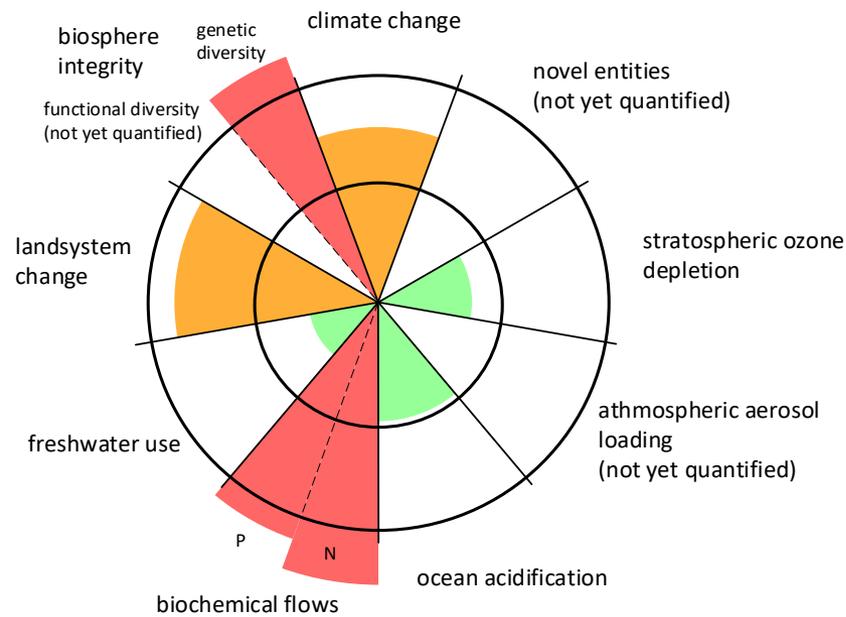

Uncertainty propagation Monte-Carlo simulation

Monte Carlo simulation

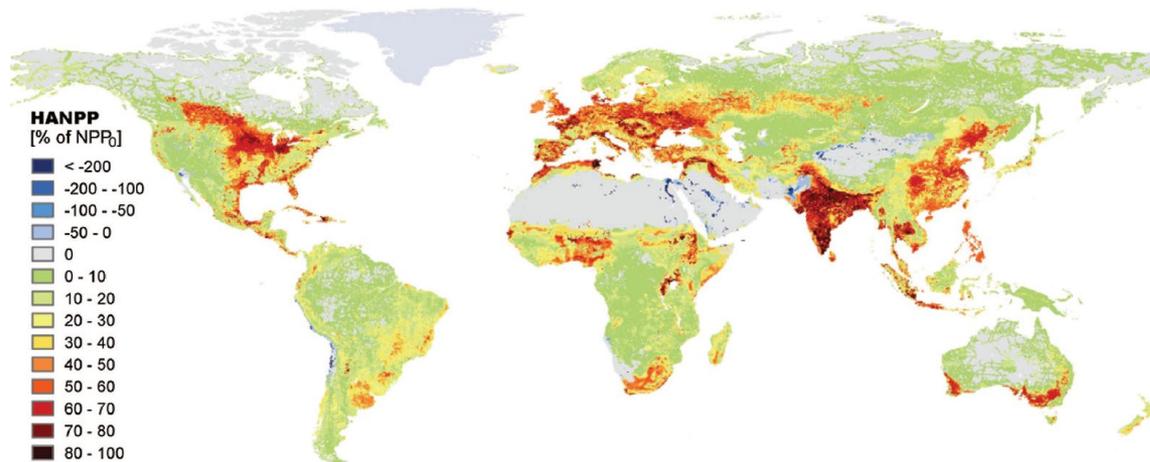

Earth system boundaries

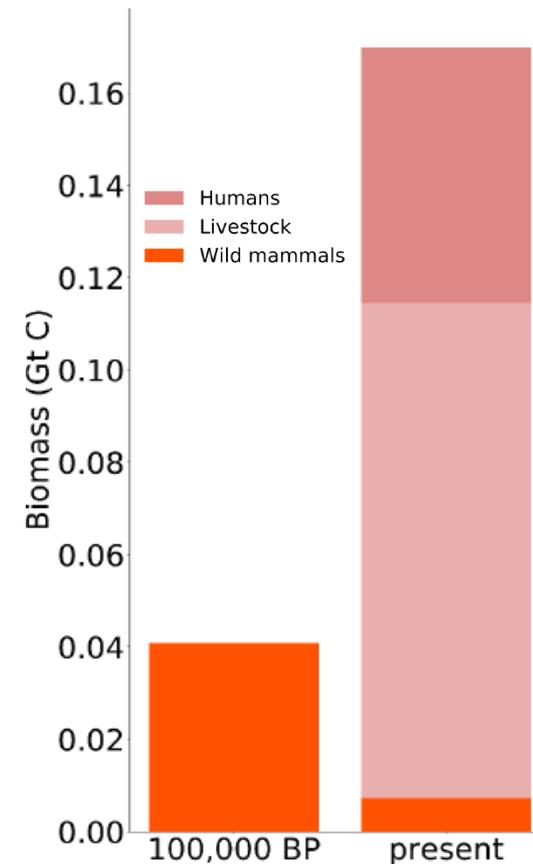

Chemical energy demand

- Human appropriation of net primary production (HANPP) already beyond safe limits

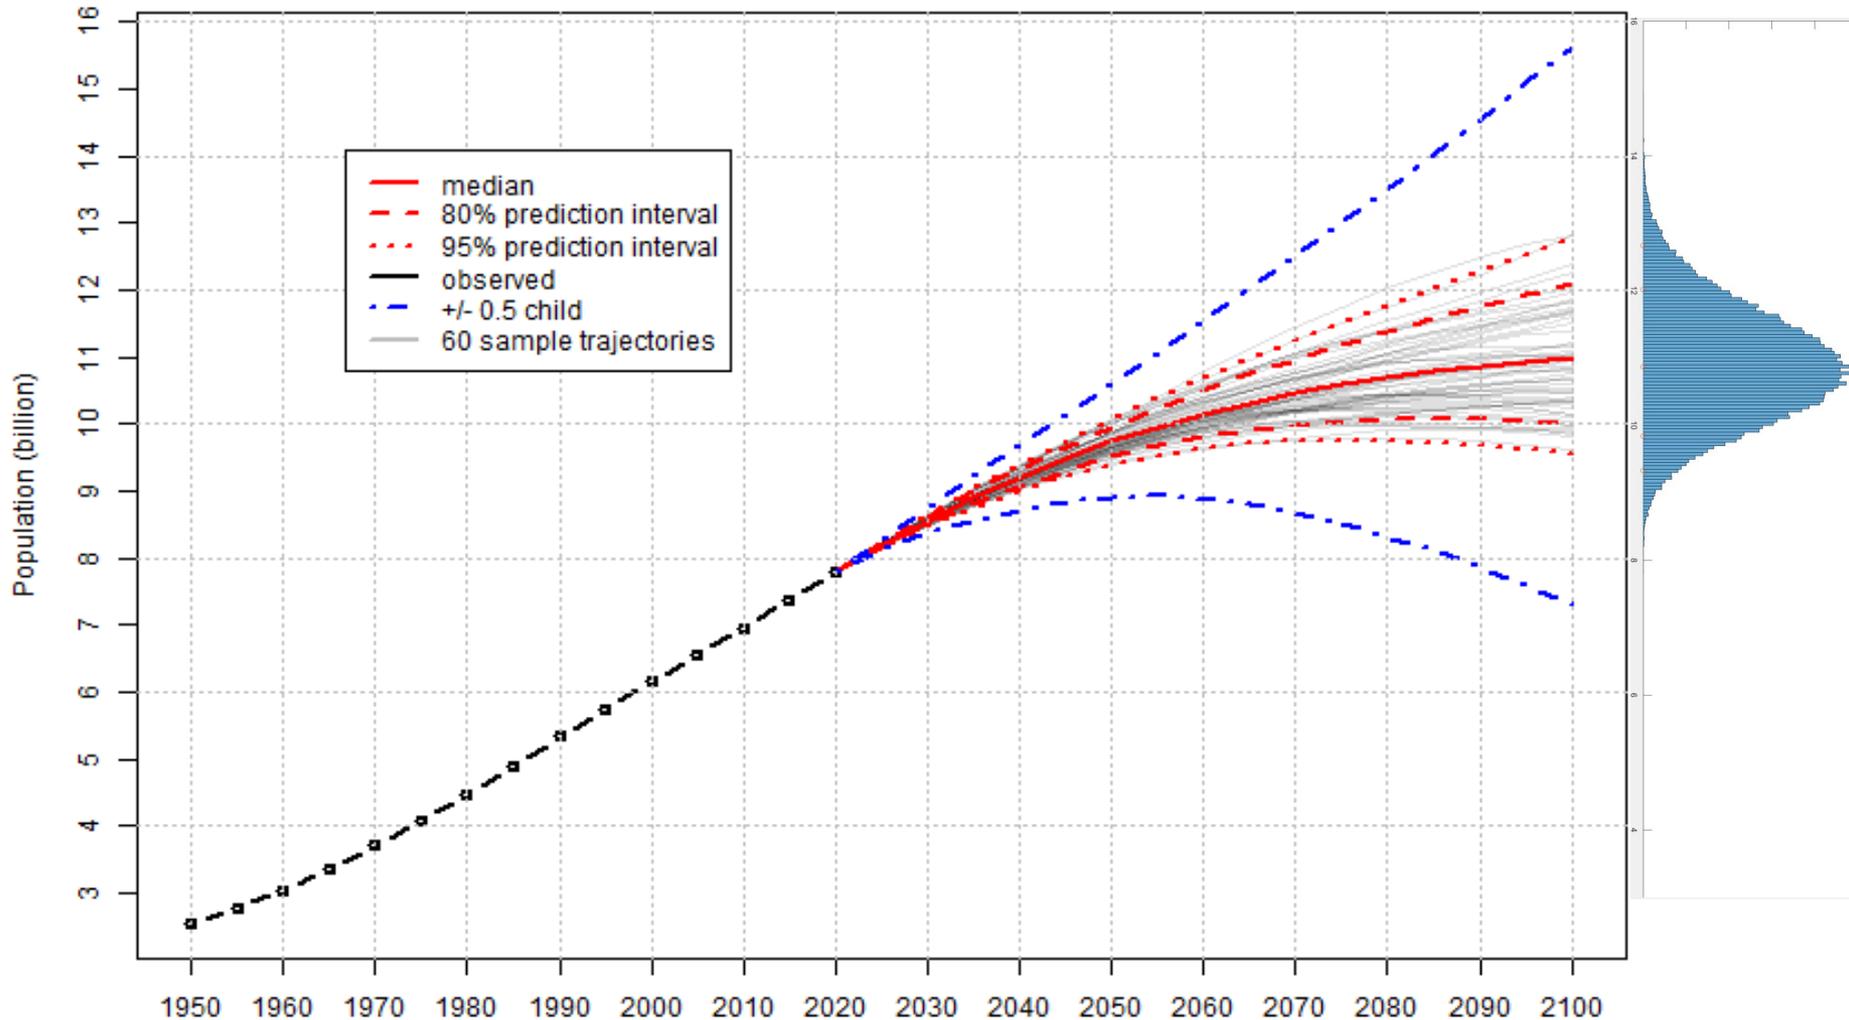

- Humans have fundamentally transformed distribution of biomass on Earth

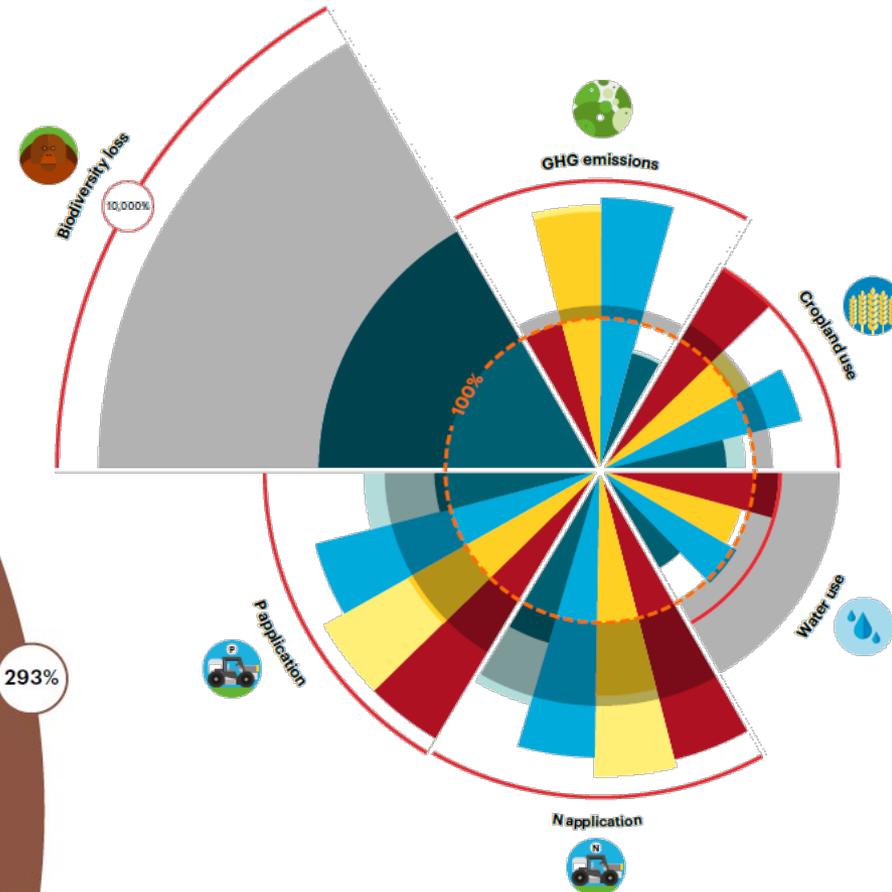

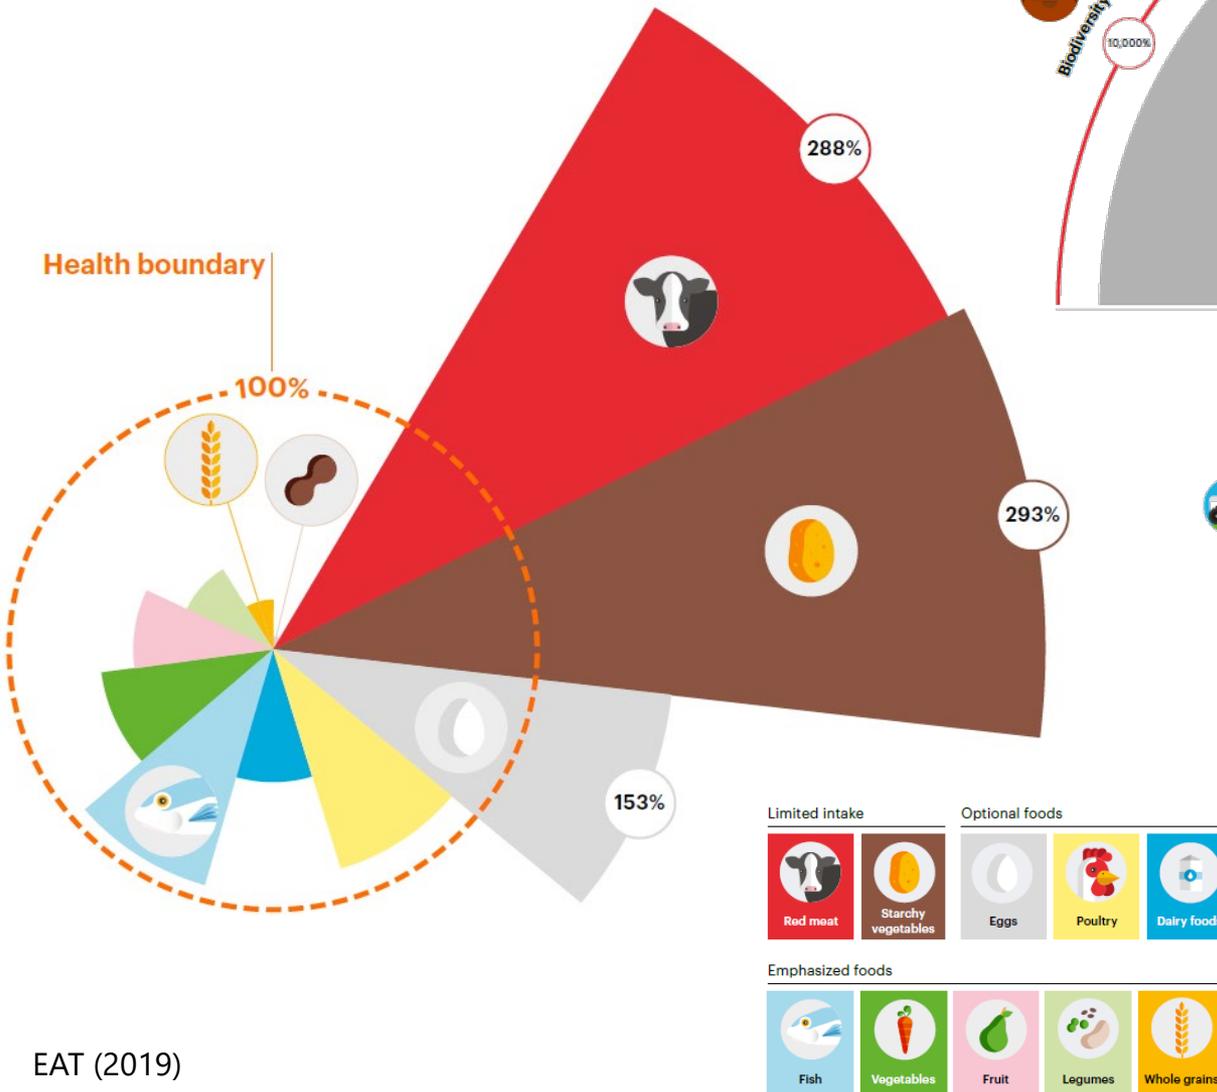

World population prospects

World: Total Population

Current diet is neither healthy nor sustainable

- Baseline projections of environmental pressures in 2050
- Dietary Shift**
Planetary Health Diet
- Halve waste**
Reduced food loss and waste
- PROD**
Improved production practices
Standard level of ambition
- PROD+**
Improved production practices
High level of ambition
- COMB**
Combination of actions
Standard level of ambition
- COMB+**
Combination of actions
High level of ambition

- Necessary mitigation efforts
 - Shifting diets towards less meat
 - Resource efficiency
 - Closing yield gaps
 - Reducing harvesting losses
 - Reducing food waste
 - Reducing demand on non-food biomass
- Other biomass uses (fuel, material) even possible?
- Bioenergy with carbon capture and storage (BECCS) possible at scale?
 - Wood doesn't compete with food (excl. plantations) and can be used first as materials and for energy second
 - All other biomass-resources are preliminarily excluded for energy purposes

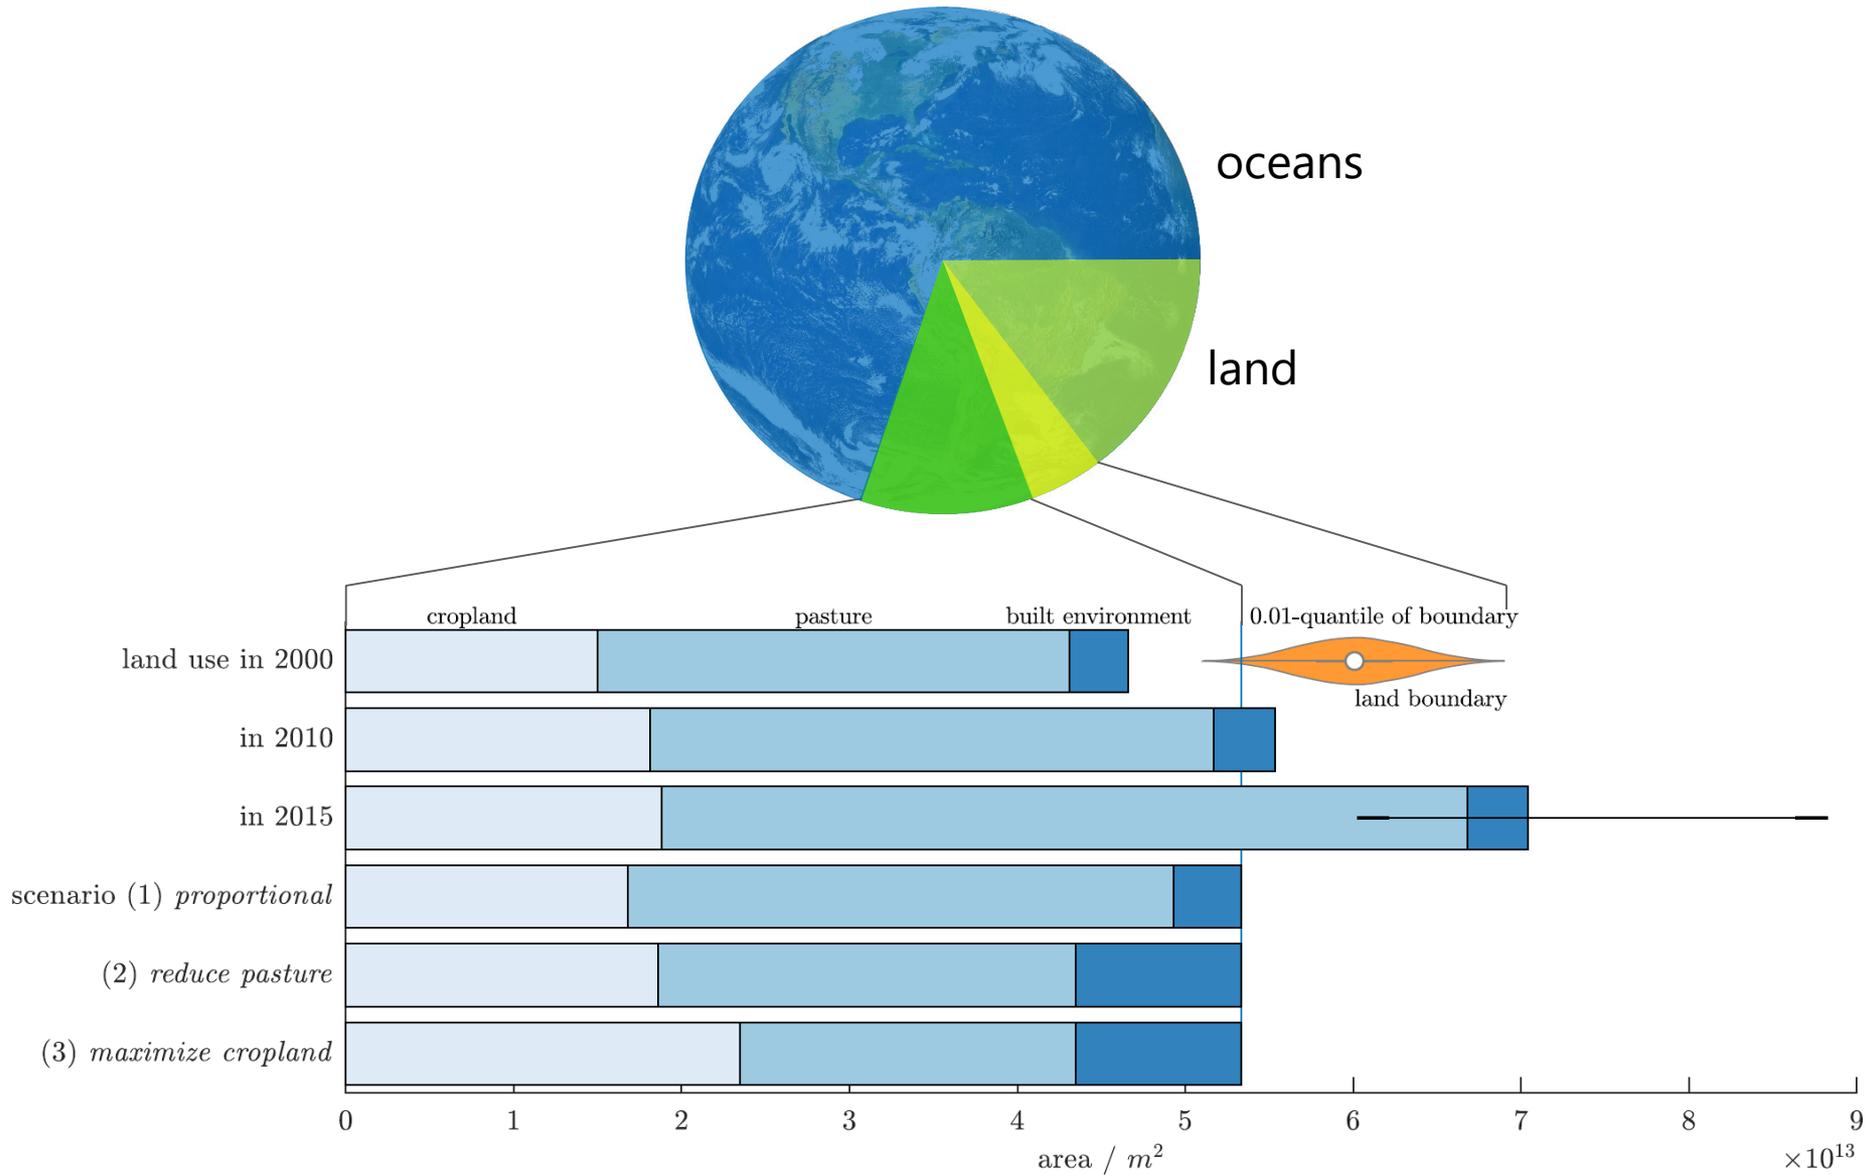

Testing the method

- Based on literature data
- Simplified technological models
- 99% confidence in the results

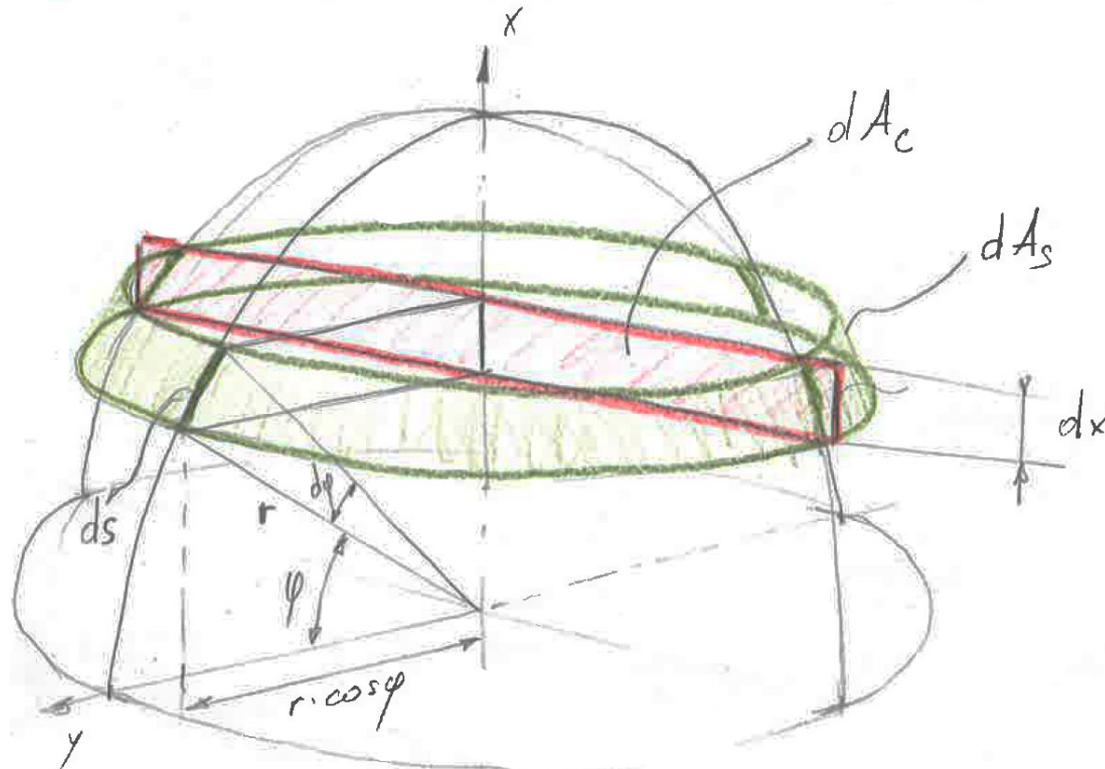

- Intended to test the method
- Results to be seen as initial
 - Further refinement in data and modeling details necessary!

Appropriability of land

Solar energy – geographical differences

$$f_{\text{irr}}(\phi_1, \phi_2) = \frac{\int_{\phi_1}^{\phi_2} dA_{\text{cross section}}}{\int_{\phi_1}^{\phi_2} dA_{\text{surface}}} = \frac{\int_{\phi_1}^{\phi_2} 2r^2 \cos^2 \phi d\phi}{\int_{\phi_1}^{\phi_2} 2\pi r^2 \cos \phi d\phi} = \frac{\phi_2 - \phi_1 + \sin \phi_2 \cos \phi_2 - \sin \phi_1 \cos \phi_1}{2\pi(\sin \phi_2 - \sin \phi_1)}$$

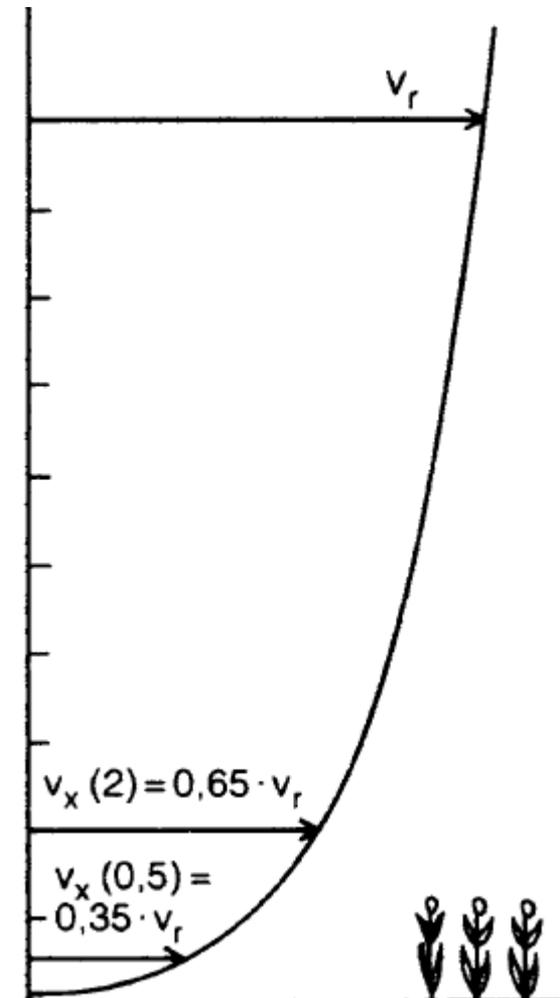

In comparison to GIS models: deviation $< \pm 4\%$
 \Rightarrow integration over large areas cancels out regional specificities

- Energy content in boundary layer

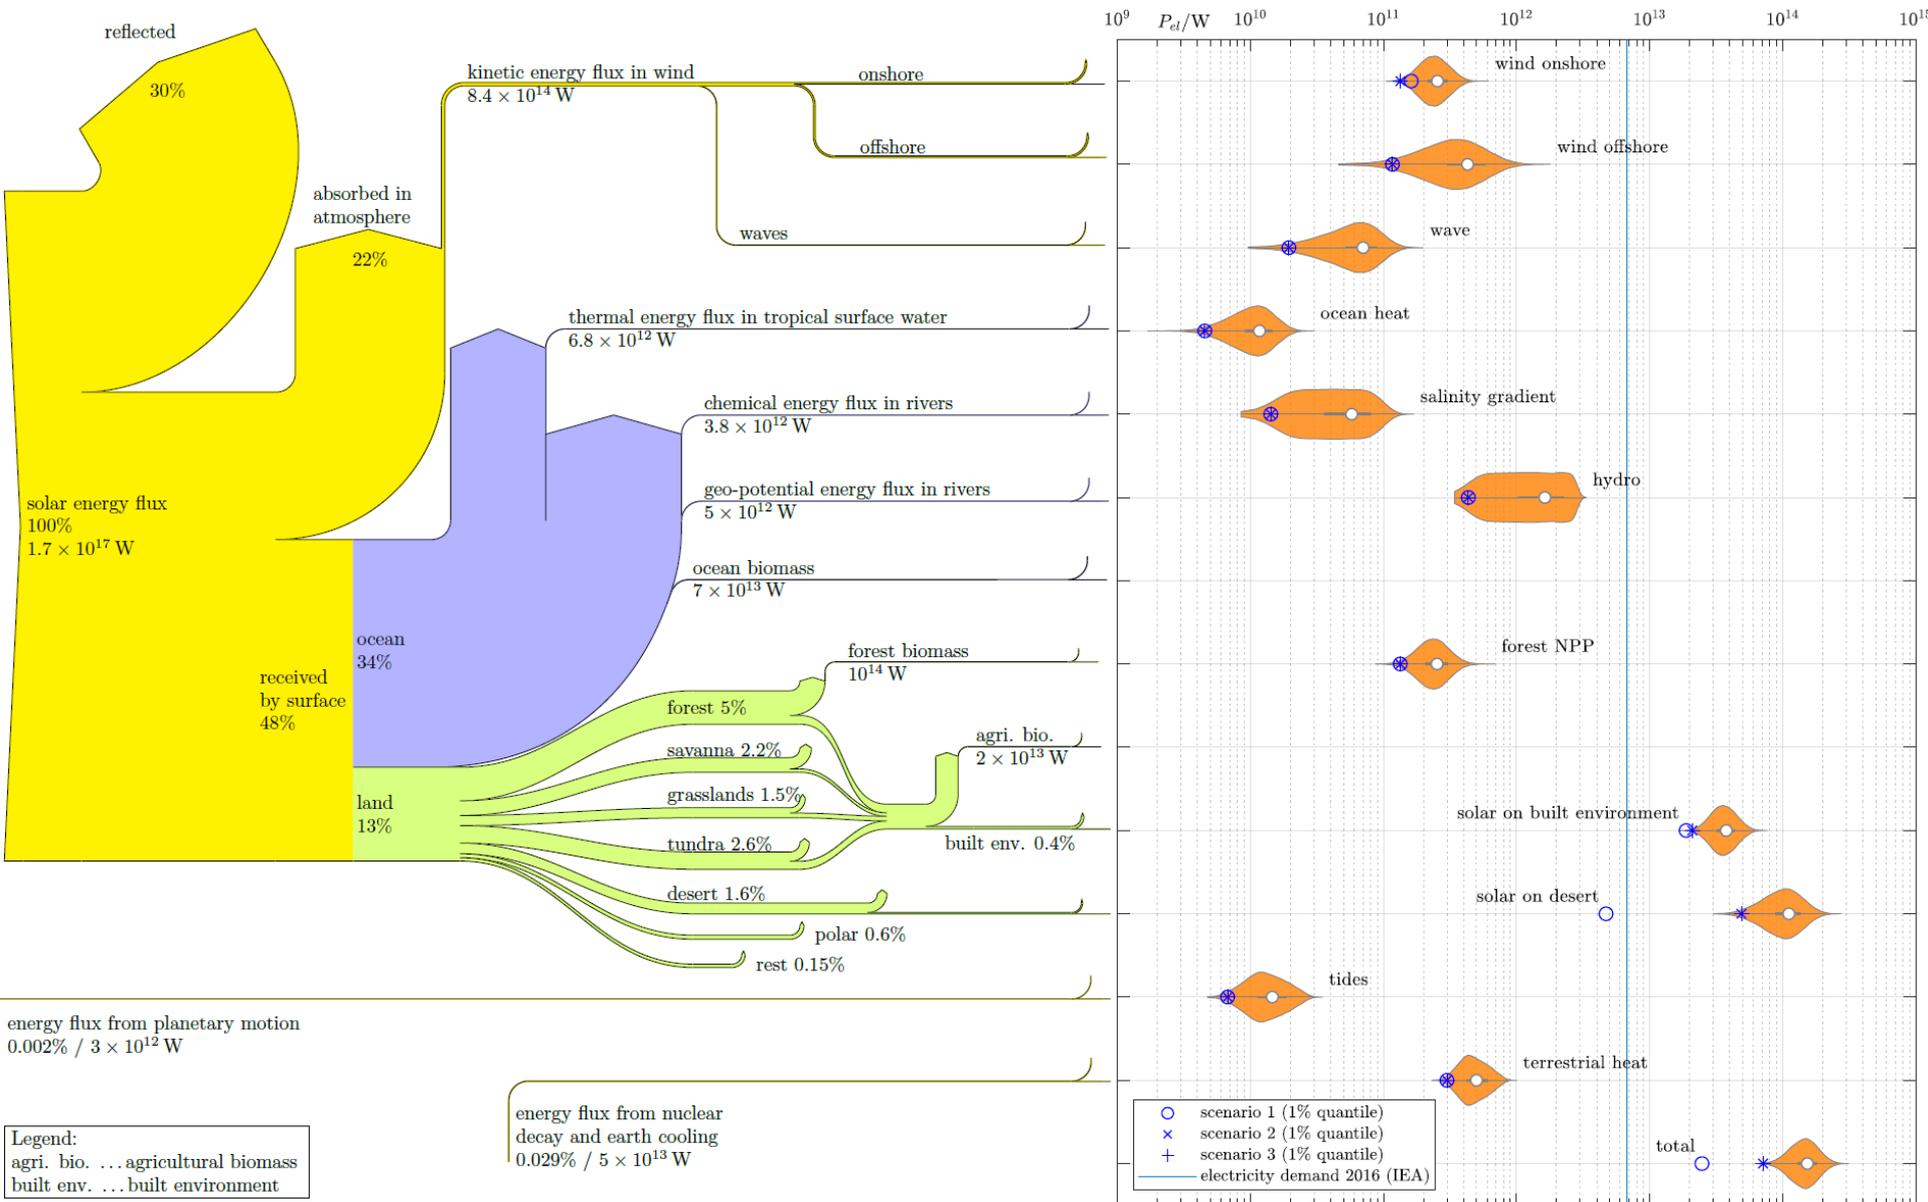

$$dP(z) = \frac{\rho}{2} \cdot dy \cdot dz \cdot v_x^3(z)$$

$$P_{\text{boundary}} = \frac{\rho u_*^3}{2\kappa^3} \cdot l_y \int_0^\delta \left(\ln \frac{z}{z_0} \right)^3 dz$$

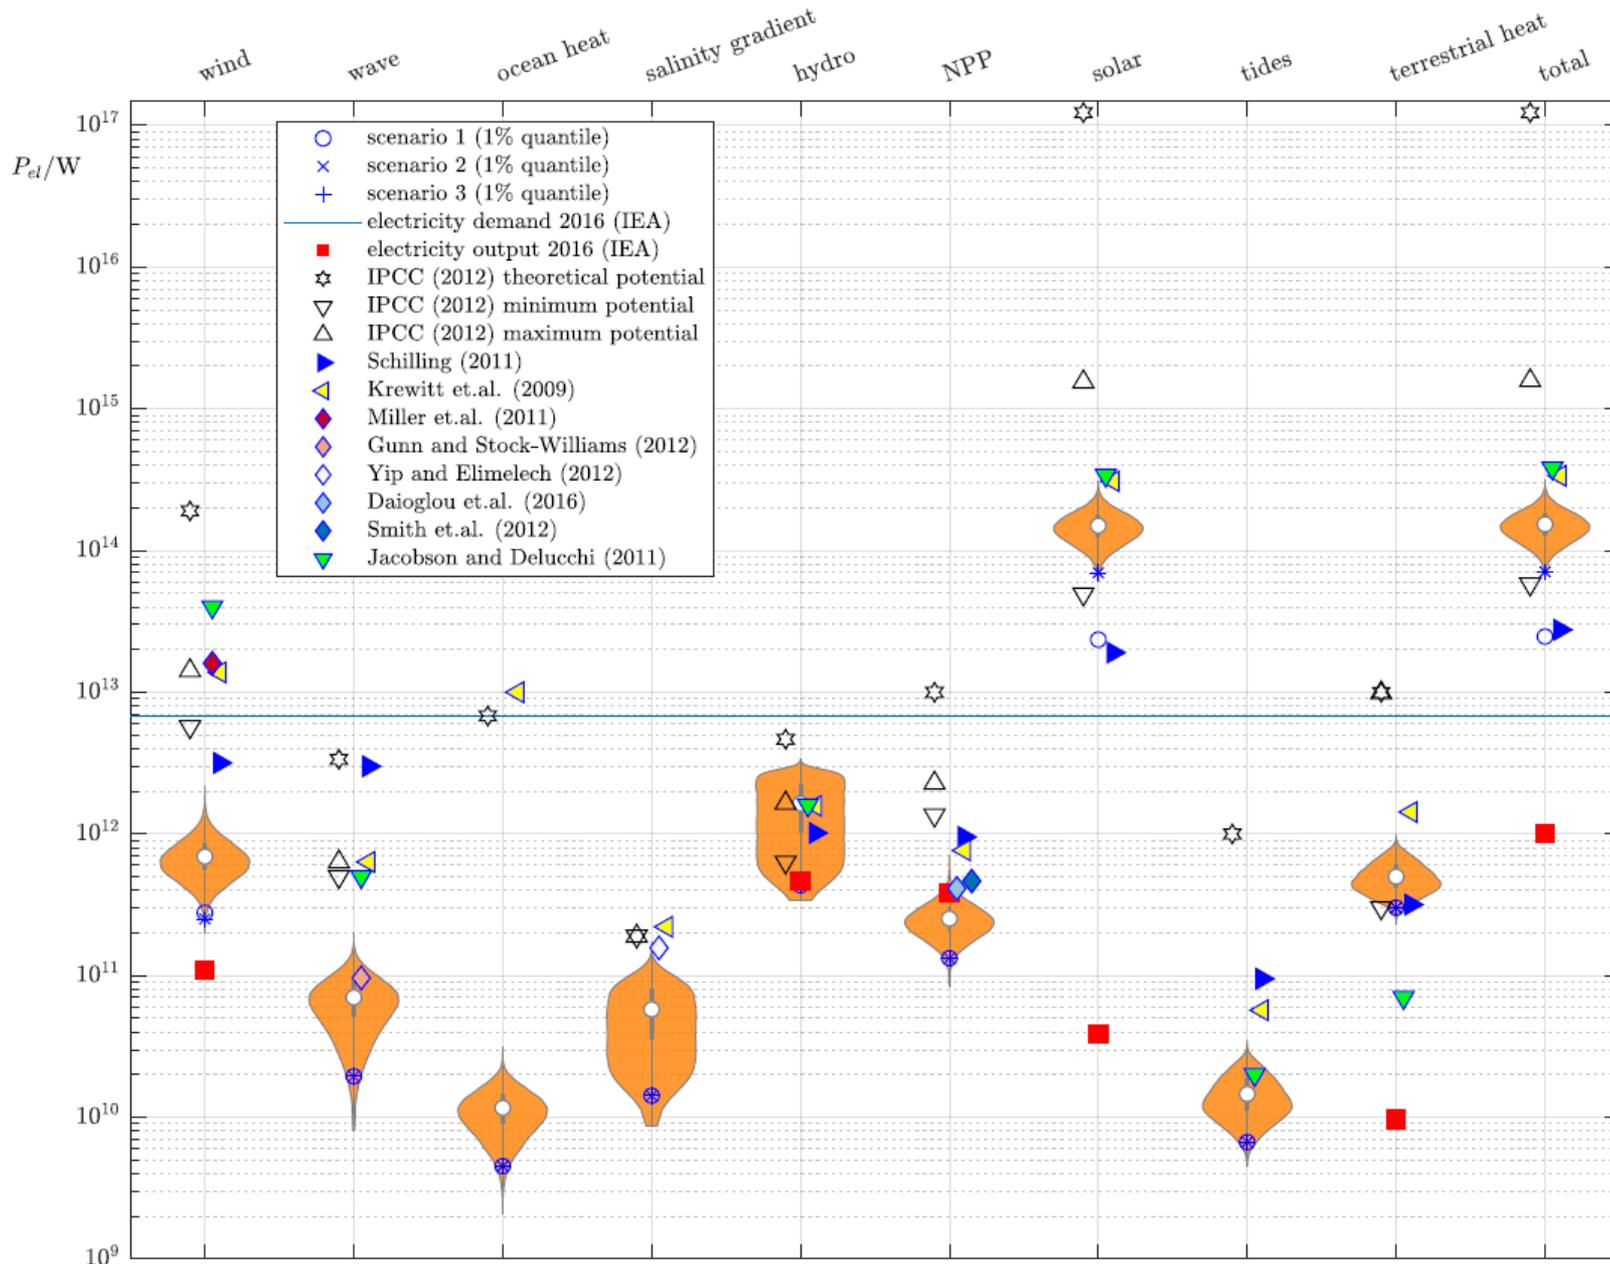

$$f_{\text{WT/BL}} = \frac{\int_{z_l}^{z_u} \left(\ln \frac{z}{z_0} \right)^3 dz}{\int_0^\delta \left(\ln \frac{z}{z_0} \right)^3 dz}$$

Results

Comparison to other studies

Current utilization of ATP

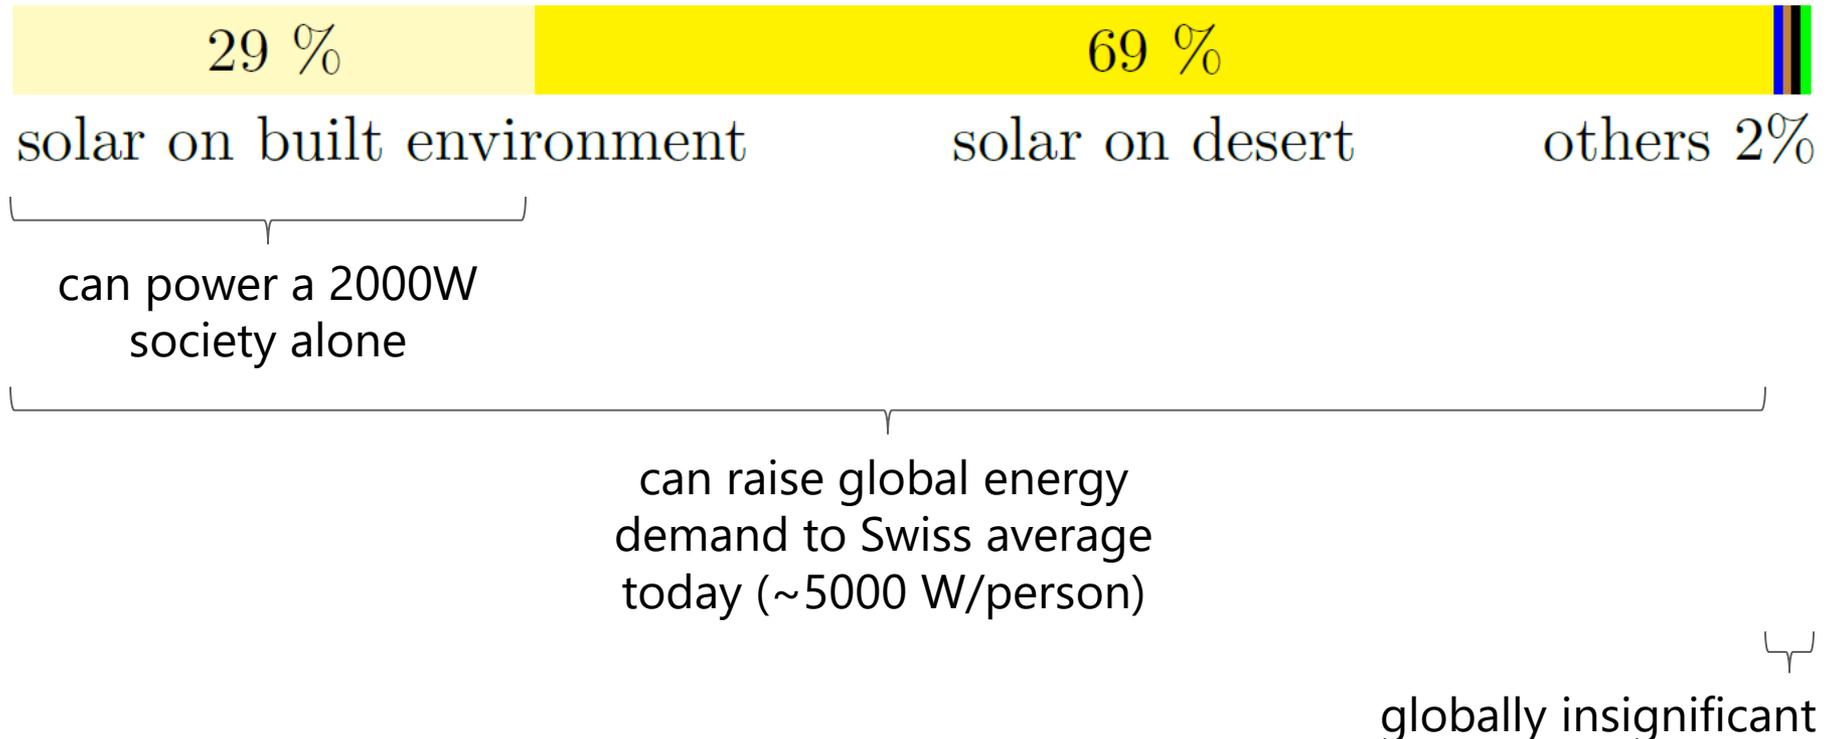

- Resource pressure indicator $\tilde{\tau}_i = \frac{P_{\text{required},i}}{ATP_i}$

- Fraction of ATP used in 2016
 - Wind 24%
 - Hydro 96%
 - Bioenergy 400%
 - Solar 0.02%
 - Geothermal 10%

 - Overall 1.5%

Putting the results into perspective

- Energy demand (2016): $P_{el} = 6.7 \text{ TW}$ ($\sim 900 \text{ W/person}_{2016}$)
- Overall ATP: $\text{ATP} = 71 \text{ TW}$ ($\sim 7800 \text{ W/person}_{2100}$)

Indicators to measure RE mix in products, companies, countries,...

Renewable energy fraction

$$REF = \frac{\sum_{i=1}^{n_{RE}} E_{el,i}}{CED_{el}}$$

Renewable energy index

$$REI = REF \cdot \left| \frac{\sum_{i=1}^{n_{RE}} (\alpha_i - \bar{\alpha})(\beta_i - \bar{\beta})}{\sqrt{\sum_{i=1}^{n_{RE}} (\alpha_i - \bar{\alpha})^2 \sum_{i=1}^{n_{RE}} (\beta_i - \bar{\beta})^2}} \right| \in [0, 1]$$
$$\alpha_i = \frac{E_{el,i}}{CED_{el}} \quad \beta_i = \frac{P_{RE,potential,i}}{P_{RE,potential,total}}$$

Examples

Energy mix	REF	REI
Global 2016	0.216	0.036
CH electricity mix	0.589	0.072
DE electricity mix	0.183	0.035
Solar powered building	1	0.99998
Biofuel	1	0.125
Transport in electric car (global average)	0.192	0.022
Transport in diesel car (global average)	0.064	0.010

- The ATP method yields precautionary estimates
- Earth system boundaries restrict RE potentials
- Chemical energy demand needs to be considered

- Still, there is enough renewable energy available, but...
 - It is mainly solar energy
 - Other energy resources of minor importance globally

- This requires:
 - Active load management by design
 - Daily and seasonal storage
 - Energy mix in products/production/operation dominated by solar

Outlook / research needs

- Regionalization
- From potential to availability
 - Including impacts from production and end-of-life treatment
- Geographical and temporal distribution system
