

# ***Distributed multi-energy-hubs: a review and techno-economic model to assess viability and potential pathways***

**Energy Science Technology Conference 2015**

S.4c: Energy System Analysis and Modelling

Karlsruhe

21 May, 2015

# Distributed solutions on district level as promising lever to cope with the increasing share of decentralized, intermittent power generation

## Increasing decentralized power generation ...

### Global new capacity additions for wind & solar PV p.a.

Source: IRENA (2015)

## ... calls for innovative, integrated solutions

- Need for flexibility measures to decouple energy supply and demand
  - Operational flexibility of generation capacity
  - Transmission & distribution grid extension
  - Storage technologies (e.g. batteries, P2G)
  - Demand side management
- Distributed, decentralized solutions as a lever to
  - increase self-consumption
  - match local production and consumption on neighborhood / district scale

## Current Project

- Overview on distributed solutions with different techn. configurations on district level
- Assessment of techno-economic performance of “Multi-Energy-Hubs”

# Agenda

- Concept of Multi-Energy-Hubs
- Multi-Energy-Hubs in Practice
- Techno-Economic Model
- Outlook

# Agenda

- **Concept of Multi-Energy-Hubs**

- Multi-Energy-Hubs in Practice

- Outlook

# What is a Multi-Energy-Hub?

## Existing terminologies / concepts in literature and our understanding

### Terminology in literature

### Selected publications

- Fabrizio et al. (2010)
- Geidl et al. (2007)
- Hemmes et al. (2007)
- Mancarella (2014)
- Manwell (2004)
- Maroufmashat et al. (2014)

### Our understanding / definition

Based on a literature review of different definitions and concepts, we are approaching multi-energy-hubs by their specific application. Thus, our understanding is as follows:

**A multi-energy-hub allows to match intermittent renewable power production with district level energy demand.**

#### Definition (based on various definitions and concepts in literature)

A multi-energy-hub is a collection of **production** (e.g. solar PV, wind turbine), **conversion** (e.g. heat pump, fuel cell) and **storage devices** (e.g. battery, hot water storage tank) which has an **input of at least one intermittent renewable primary energy source** (e.g. solar, wind), deals with **multiple energy carriers**, allows for **conversion from one energy carrier to another**, and provides energy carriers as output to serve specific energy services (e.g. lighting, space heating, mobility).

Source: Geidl et al. (2007), Hajmragha et al. (2007), Kienle et al. (2011), Manwell (2004), Hemmes et al. (2008), Mancarella (2014)

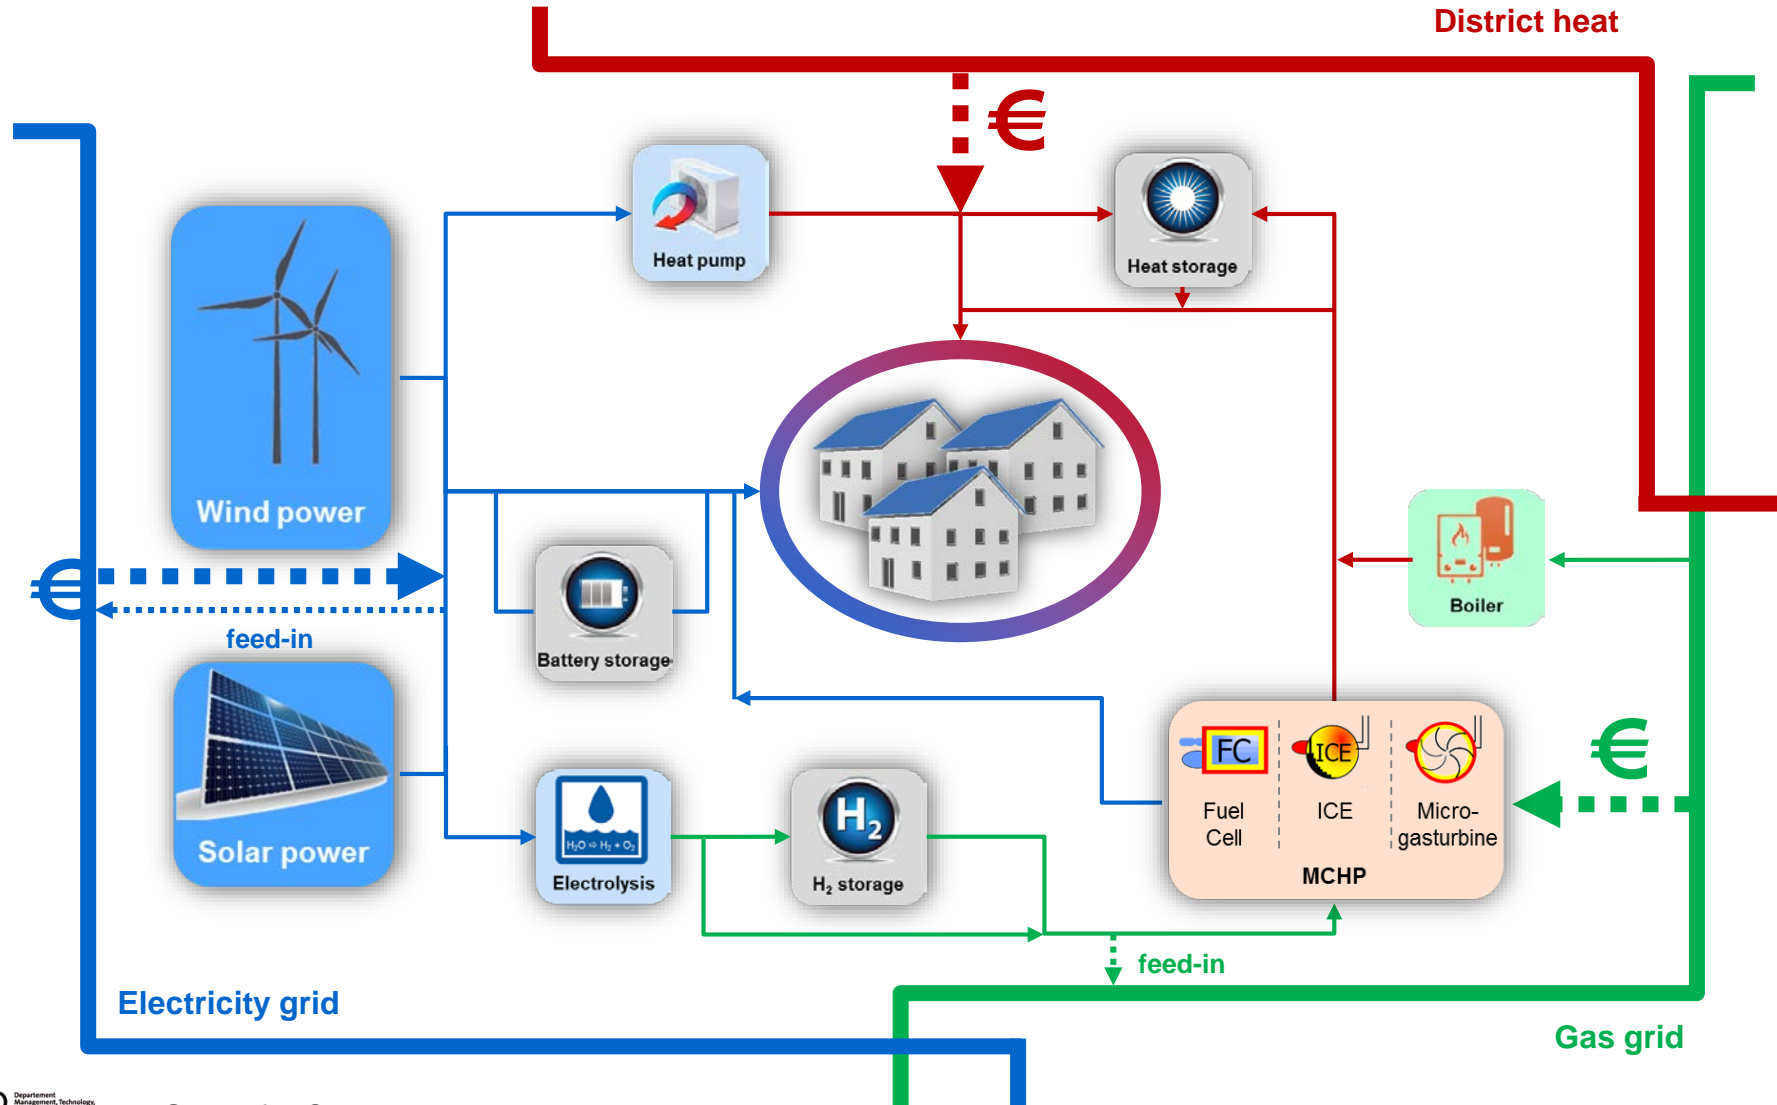

#### Remarks

- **Spatial perspective** of this research is on **building and neighborhood / district level**
- **"Primary energy** is the energy embodied in natural resources (e.g., coal, crude oil, natural gas, uranium) that has not undergone any anthropogenic conversion." II
- **"Energy carriers** include electricity and heat the energy supply chain between primary so energy" IPCC (2007)
- **Production devices** convert a primary energy
- **Conversion devices** convert one energy ca
- **Storage devices** allow the storing of energy

# What is a Multi-Energy-Hub?

Our simplified depiction of the concept with P2G on district level

# Agenda

- Concept of Multi-Energy-Hubs
- **Multi-Energy-Hubs in Practice**
- Techno-Economic Model
- Outlook

# To add market perspective, we are currently compiling important insights on existing/planned multi-energy-hub projects in a database

## Containing information on ...

- **Location**
- **Technologies integrated**
  - Type (e.g., PV, heat pump, battery)
  - Rating (e.g., capacity, efficiency)
  - Manufacturer
- **Ownership model**
  - Type
  - Name
- **Schedule**
  - Operating status
  - Construction date
- **Funding**
  - Source
  - Amount
- **Grid connectivity**
- **Motivation, drivers / barriers**
- **Current / future market services**

## Split of technologies across projects, in #

### Production technologies

20	17	6	6	6	2	2
SolarPV	Wind	Solar-Thermal	Boilers	CHP	Hydro	Biogas

### Conversion technologies<sup>1)</sup>

18	16	9	3
Electrolyzer	Fuel cell	Heat Pump	ICE

### Storage technologies<sup>1)</sup>

18	14	12
Gas	Thermal	Electrical

- Total # of 29 projects added to date
- Geographical focus: USA & Europe

# According to hub size, clusters emerge with different production technologies in use (preliminary sample analysis of project database)

Project split across installed electric production capacity, 24 projects

# A deep-dive into two selected projects reveals the differences of multi-energy-hubs in terms of e.g., size, technologies, motivation

## P8 — Energieautarkes MFH Brütten

- Demonstration project for a grid independent Multi-Family-House (MFH), under construction since 2015, scheduled operation for 2016
- Supplies residential heat and electricity demand for a MFH with 9 residential units, no grid connectivity for electricity, gas and heat
- Integrated technologies
  - Production: Solar PV (100 MWh/yr)
  - Conversion: Electrolyzer, MCHP (fuel cell), and heat pump
  - Storage: Battery (tbd.), hydrogen storage (in vessels), and thermal storage
- Innovative pricing scheme, i.e., no direct energy cost but energy budget incl. bonus/malus system

## P20 — SmartRegion Pellworm

- Demonstration project to achieve maximum utilization of local intermittent renewable energy sources (wind and solar), in operation since 2014
- Supplies residential heat and electricity demands of Pellworm but grid-connected to mainland, GER
- Integrated technologies
  - Production: Solar PV (2.7 MW<sub>p</sub>), wind turbine (5.7 MW), and biogas-CHP (0.5 MW<sub>e</sub>)
  - Conversion: Heat pumps
  - Storage: Battery (lithium-ion, 1 MW), battery (redox-flow, 0.2 MW), and thermal storage
- Project consortium consists of 8 members coordinated by E.ON SE, involving private, government and university partners

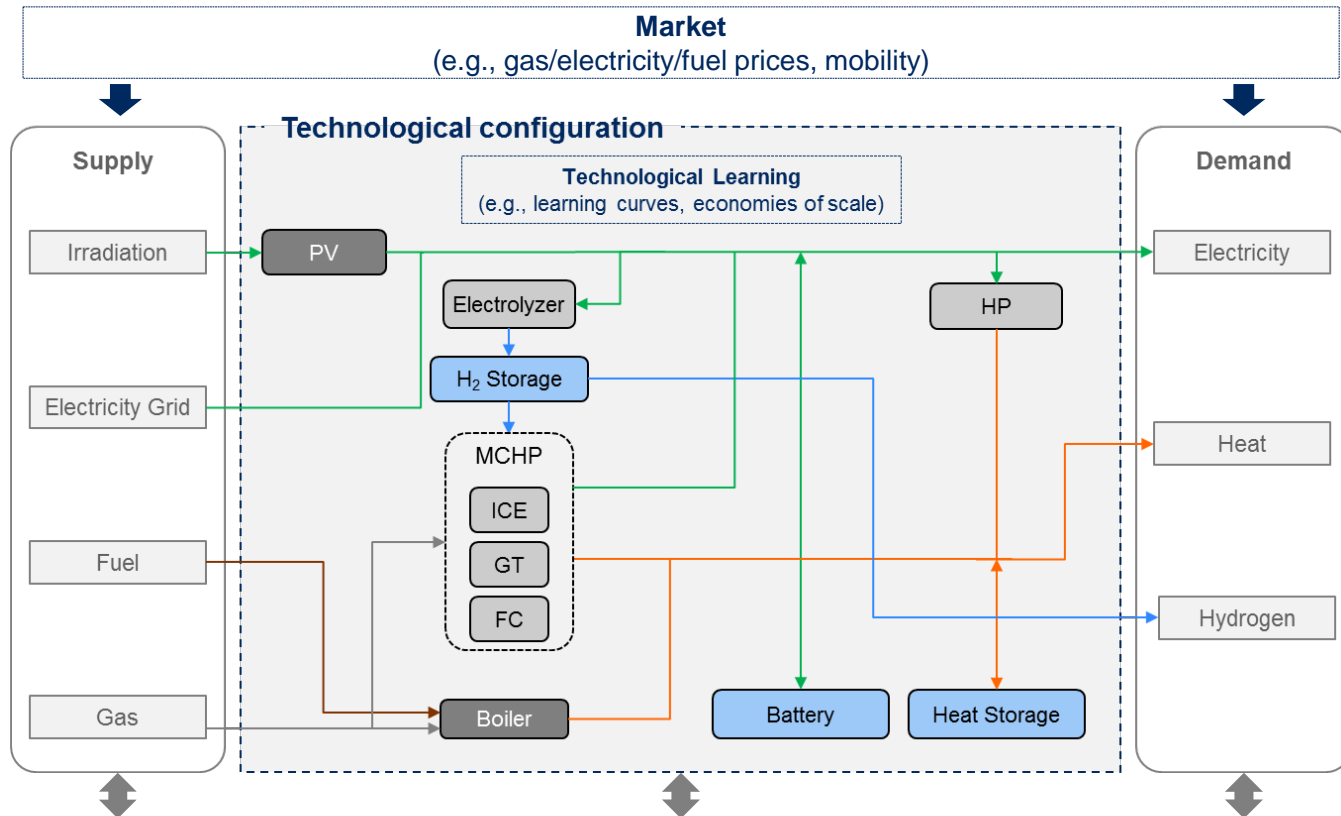

# Agenda

- Concept of Multi-Energy-Hubs
- Multi-Energy-Hubs in Practice
- **Techno-Economic Model**
- Outlook

# Structural overview on the techno-economic model

**External Environment** (conditioned by **Policy**, e.g., incentives, taxes, subsidies)

# Model implementation: Input and output parameters using MATLAB

## Input Parameters

Load curves  
electricity & heat

Financial &  
market data

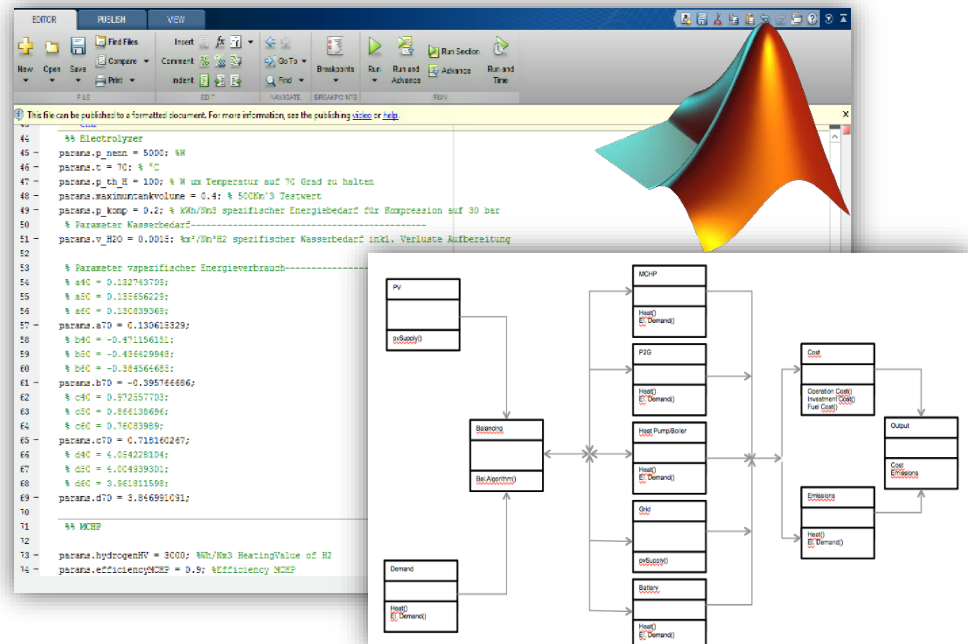

Technology &  
economic data

Weather data

Building features

## Output Parameters

Economic  
viability

System  
efficiency

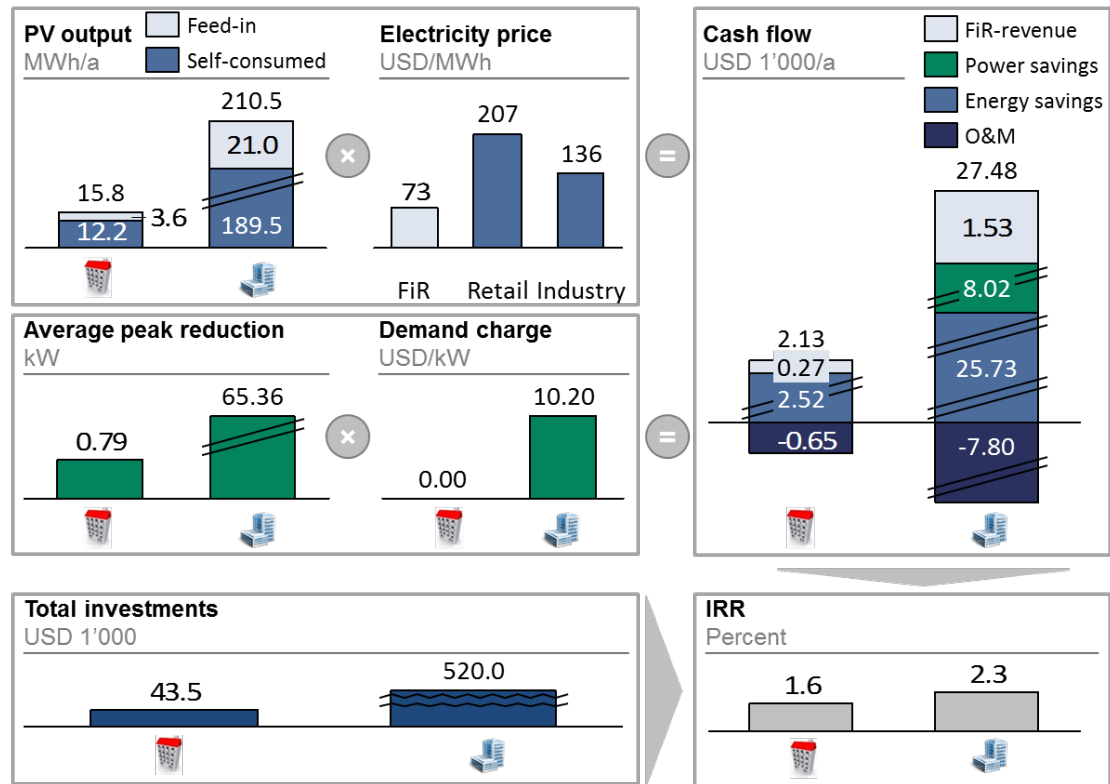

Hub & techn.  
sizing

# As we are currently finalizing the development of the model, first results are expected this summer

## Expected results / findings

- Current cost barriers and major cost drivers
- Overview on key performance indicators
  - NPV with cash flow calculation (investment, O&M, savings)
  - CO<sub>2</sub> mitigation cost
- Ideal techn. configurations and sizing for different hub types and applications
- Share of self-sufficiency (cost to be grid independent)
- Influence of techn. learning potential and market dynamics
- Spatial differences for locations in scope (DE, CH, AT, IT)

## Previous research: Self-consumption (PV + Battery)

Multi-Family

Large Office

# In a second step, the techno-economic model is refined by adding both scenario and sensitivity analyses

## Scenario Analysis

Testing of model results under different scenarios, e.g.,

### Technological configurations

- “High RES share”
- “Battery-only”
- ...

### Economic environment

- “Zero-subsidies”
- “High gas/ electricity price”
- ...

Table 4: Electricity price scenarios used in model simulations

Scenario	Assumption	Electricity Wholesale Price Scenario	Electricity Retail Price Scenario
S1		High: +3% per year (real)	High: +2% per year (real)
S2	Unlimited access of household to wholesale market	Low: -1% per year (real)	
S3		Medium: +1.5% per year (real)	Medium: +1% per year (real)
S4		High: +3% per year (real)	Low: +0% per year (real)
S5		Low: -1% per year (real)	
S6	No access of household to wholesale market		High: +2% per year (real)
S7		Constant: 0 EUR/kWh	Medium: +1% per year (real)
S8			Low: +0% per year (real)

## Sensitivity Analysis

Testing of model results by varying input parameters, e.g.,

- Sizing of PV, storage, hub
- Plant lifetime
- Capex / Opex
- Efficiency
- Discount rates
- ...

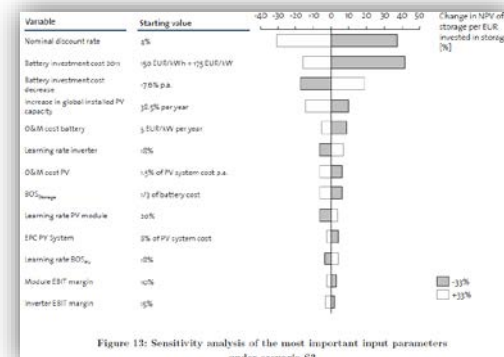

Figure 13: Sensitivity analysis of the most important input parameters under scenario S3

# Agenda

- Concept of Multi-Energy-Hubs
- Multi-Energy-Hubs in Practice
- Techno-Economic Model
- **Outlook**

## Outlook & next steps: Results from the techno-economic model are expected by July, the database will be further complemented too

### Techno-economic model

- Finalization of **integration of remaining technologies** and economic aspects
- **Validation of model assumptions** / preliminary results by **real test cases** and **experts**
- **Results on techno-economic assessment** in different technological configurations
- **Addition** of second model step with **scenario** and **sensitivity analyses**

### Database on market installations

- **Addition of more projects** to the database **to achieve comprehensiveness**
- **Detailed analysis of selected projects** to gain deeper, qualitative understanding
- **Evaluation of overall data** to obtain insights, e.g., predominant technical configurations, rationale / motivation, barriers

### Organizational implications

- Compiling of **qualitative interviews** with multi-energy-hub owners, operators, tech. manufacturers to **understand barriers/drivers** at the **individual** and **firm level**
- **Derivation of policy implications**, i.a. instruments to foster the implementation of multi-energy-hubs

**Thank you for your kind attention!**

# What is a Multi-Energy-Hub?

## Definition according to different concepts in literature

**Definition** (based on various definitions and concepts in literature)

A **multi-energy-hub** is a collection of **production** (e.g. solar PV, wind turbine), **conversion** (e.g. heat pump, fuel cell) and **storage devices** (e.g. battery, hot water storage tank) which has an **input of at least one intermittent renewable primary energy source** (e.g. solar, wind), deals with **multiple energy carriers**, allows for **conversion from one energy carrier to another**, and provides energy carriers as output to serve specific energy services (e.g. lighting, space heating, mobility).

Source: Geidl et al. (2007), Hajimiragha et al. (2007), Kienzle et al. (2011), Manwell (2004), Hemmes et al. (2008), Mancarella (2014)

### Remarks

- **Spatial perspective** of this research is on **building and neighborhood / district level**
- **“Primary energy is the energy embodied in natural resources (e.g., coal, crude oil, natural gas, uranium) that has not undergone any anthropogenic conversion.”** IPCC (2007)
- **“Energy carriers include electricity and heat as well as solid, liquid and gaseous fuels, occupy intermediate steps in the energy-supply chain between primary sources and end-use applications. An energy carrier is thus a transmitter of energy”** IPCC (2007)
- **Production devices** convert a primary energy source into an energy carrier (e.g. solar PV, wind turbine, biogas plant)
- **Conversion devices** convert one energy carrier to another energy carrier (e.g. electrolyzer, fuel cell, heat pump)
- **Storage devices** allow the storing of energy carriers (e.g. battery, hot water storage tanks, hydrogen storage tanks)
