

1) to save life and have a good life quality, we need a strong health care system. This requires strong funding from a rich and striving economy. Decision makers seem to have forgotten that lives are saved by first having a strong economy. and save lives from risk hunger for poor countries, due to the supply chain issues...

2) frame the issue of confinement not in terms of lives vs economy or money, but between lives and lives. Risk hunger and death for poor countries, due to the supply chain issues, many deaths catalysed by consequences of confinement and economic disruptions remain to be quantified over the coming months.

3) measures have focused on robustness of society, we should complement with a very strong program on INDIVIDUAL RESILIENCE

4) It is not the pandemic (which has happened many times in the history with much worse virus) that is going to change the world, it is the unprecedented and massive response of the governments that will change the world completely. Whether all these can be justified should be judged by the history, but we can already envision some not very good result. Maybe we are at a phase transition time now.

5) projection of the elderly population in the coming 30 years.
The next pandemic of the same sort will be much worse if we do not think in advance the proper ways to protect our fragile population.

6) The most important questions to consider:
- why was the crisis badly handled?
- what can we do now to reduce the impact of the crisis?
- Can we use this situation as an advantage?
